Hobbesian Wars and Separation of Powers[*]

April 16, 2022

Abstract

To investigate the relationship between political authority and civil conflict in weakly institutionalized environments, we analyze the Markov perfect equilibrium of a dynamic game of contest and persecution in a king's council. In the game, in each period, council members can contest the kingship; the emerging king can propose persecution subject to the council's vote given a decision rule, which measures the degree of political authority. We show that it is only under unanimity rule that civil peace will be secured, whereas under any non-unanimity rule, perpetual Hobbesian wars can feature in equilibrium, with every council member contesting the kingship in each period. Allowing the council to change its decision rule periodically, we show that separating the king from the council's agenda-setting power on constitutional issues is critical to the resilience of unanimity rule. Introducing a judiciary that oversees persecution, we show that under a non-unanimity rule, civil peace can be preserved only if the judicial members are socially cohesive with the subjects of persecution *and* cannot join the executive council later. We discuss the implications of our results for a wide range of political-economic issues with historical and contemporary examples.

1   Introduction

Thomas Hobbes has famously argued that under the "natural condition of mankind," i.e., in weakly institutionalized environments where people are not capable of trusting, committing to, and contracting with each other, every person will engage in "a war of every man against every man," and the only way to avoid such Hobbesian wars is a sovereign "to keep them all in awe" by "coercive power" (Hobbes, 1996, p. 82, 84, 91, 130). Following this idea, many major thinkers in social sciences have contemplated political authority, especially one that monopolizes legitimate violence, as critical to preserving civil peace (e.g., Weber, 2004; Mann, 1986; Finer, 1997a). In the political economy literature, recent important examples along this tradition include but are not limited to Acemoğlu, Robinson and Santos (2013), Powell (2013), and Sánchez de la Sierra (2020).

In this paper, we explore an opposite idea: political authority may tempt everyone to contest it and thus cause a Hobbesian war of "all against all" for political authority. Does this idea hold in a weakly institutionalized environment as in Hobbes's argument? What kind of constraints on political authority can prevent such wars over such authority? What implications can we draw to better understand institutional safeguards against unchecked or unitary authority, such as veto power and separation of powers, and thus how to avoid civil conflict?

We investigate these questions in a dynamic game of political contest and persecution in a king's council, composed of the king and important members of the elite. The setting is stylized but also typical for ancient polities (e.g., Weber, 1978, 2004; Finer, 1997a; Konrad and Skaperdas, 2007; Myerson, 2008; Stasavage, 2020a). In the game, in each period, any member of the council can contest the kingship; after the contest, the emerging king can propose to persecute and expropriate a number of council members, only if fewer than a certain number of council members vote against the motion. The required number of members to block persecution defines the decision rule of the council, representing the degree of political authority and the constraints it faces. At one end, when the motion to persecute can go through even if all other council members vote against it, the king is a dictator who has unlimited authority; at the other end, when a single council member can veto the motion on her own, the king has little authority and the council functions by unanimity rule; in between, when more than one negative votes can strike down the motion, for example if some form of majority rule is used, the council is democratic since the king is obliged to seek consent for executive decisions, but only to a degree. The focus on weakly institutionalized environments is guaranteed by limiting our attention to the (pure-strategy) Markov perfect equilibrium (MPE), in which the king cannot commit to spare any council member from

being persecuted, even conditional on their past behaviors.

We analyze how the equilibrium of the game depends on the decision rule of the council. We show that, under any non-unanimity rule, whenever becoming the king is lucrative, for example, when the social intertemporal discount factor is sufficiently close to one, there will be a unique MPE in which all council members contest the kingship in every period, engaging in perpetual Hobbesian wars over political authority. The reason is that, in a weakly institutionalized environment under a non-unanimity rule, any council member who would not contest the kingship could still be persecuted, while contesting the kingship would give her a chance to persecute and expropriate at least one council member after becoming the king. The option to contest will thus dominate the option not to contest, whenever the value of the expropriated asset from even a single persecuted council member becomes sufficiently high, which is true when the social intertemporal discount factor is approaching one. Therefore, it is only when the council makes persecution decisions by unanimity rule that perpetual Hobbesian wars can be avoided, since only unanimity rule grants every member the right to veto any persecution, shutting down simultaneously everyone's possibility of being persecuted and, thus, the lure of the kingship.

On the basis of these baseline results, we examine the issue of stability and transition of decision rules in our model. We allow an agenda-setter, either the king or a council member at the end of each period, to propose a change in the decision rule for the next period, subject to the approval of the council, following the current decision rule. We show that, although unanimity is stable, i.e., an absorbing state, regardless of who sets the constitutional agenda, whether a non-unanimity rule will transition to it depends on where the agenda-setting power lies: if it is always the king at the time who sets the constitutional agenda, he will not suggest unanimity rule but will have dictatorship approved by the council, so any non-unanimity rule will transition to dictatorship, leading to perpetual civil conflict; if it is always a council member at the time who sets the agenda, the council can just implement its preference for unanimity, so any non-unanimity rule will transition to unanimity, leading to perpetual peace. Separating the king from the agenda-setting power of the rest of the council on constitutional issues is thus key to the resilience of civil peace and the institution guarding it, i.e., unanimity rule.

Since the king's persecution power is at the core of our analysis, it is natural to ask, when the executive council functions under a non-unanimity rule, whether and under what conditions a judiciary that oversees persecution could robustly prevent persecution and thus avoid perpetual Hobbesian wars. To answer the questions, we modify our baseline model by introducing a judiciary that oversees persecution and allow its institutional and socioeconomic conditions to vary along two dimensions. One is the degree of *judicial insulation* from

the executive power, which is measured in our model by how many members of the judiciary will later not be part of the council and thus will not have the opportunity to contest the kingship. The other is the level of *social cohesion* among the members of the judiciary and the executive council, which is measured by the negative externality that persecution of a council member would inflict upon all other members of the judiciary and the council. We show that, given a non-unanimity rule in the council, the judiciary can prevent persecution and confer civil peace only when the levels of *both* social cohesion and judicial insulation are sufficiently high, because only under these conditions the king would not afford to buy off the judiciary to have persecution approved.

We discuss a few implications of these results. Our baseline results provide an empirically relevant alternative to the Hobbesian reading of the relationship between political authority and civil conflict. They also provide a novel justification for protecting human rights at the individual, not at any collective level.

The results on stability and transition of decision rules help us explain the bimodality of political regimes between dictatorship and unanimous democracy in premodern times, and the dominance of the former in the period. The results also imply that separating the executive from the agenda-setting power on constitutional issues makes it possible for unanimous democracy to grant temporary emergency power to the executive, because of the credible return to unanimity rule afterwards. On this implication, case studies comparing the Florentine Republic versus the Venetian Republic, and the American vetocracy versus the consensual leadership of the Chinese Communist Party, are discussed.

The results on the role of a persecution-overseeing judiciary, social cohesion, and judicial insulation help us explain why early modern England, where the monarch successfully curtailed strict mandates and veto power of local constituencies and thus mimicked a non-unanimity rule for executive actions, transitioned from perpetual civil wars to peace at the turn of the 17th century. The results also help us understand why such non-unanimity rule was not adopted in other premodern or early modern European states, such as the Athenian democracy and the Venetian Republic, which lacked an insulated judiciary, or most other Italian city-republics and the Polish–Lithuanian Commonwealth, where social cohesion between the judiciary and other elite members were low, or the French *Ancien Régime,* Crown of Castile, and Dutch Republic, where both social cohesion and judiciary insulation were absent.

Finally, when taking all the theoretical results together, we derive a hypothesis on the evolution of separation of powers. As social cohesion rises during the Durkheimian process of socioeconomic modernization (Durkheim, 2014), our results suggest that such modernization can be companied by a transition from separating the *executive and legislative* powers to

separating the *executive and judicial* powers. This is because, when social cohesion is low, society relies on unanimity rule to preserve peace, while the resilience of unanimity rule relies in turn on the executive–legislative separation; when social cohesion is high, civil peace becomes possible under a non-unanimity rule, but this possibility depends critically on the executive–judicial separation. We discuss the relevance of this hypothesis in detail.

The paper is organized as follows. The rest of this section clarifies our position in the literature. Sections 2, 3, and 4 present the setups and results of the baseline model, the extension with endogenous decision rule, and the modification incorporating the judiciary, respectively. Section 5 discusses the implications of the three sets of theoretical results in sequence. Section 6 concludes with the discussion on the evolution of separation of powers and beyond. Proofs of results are gathered in the Appendix.

Position in the literature. The overarching idea of our paper is that persecution power can attract violent contests for such power, and our analysis shows that this idea can provide implications on a diverse set of political-economic issues. Our paper thus bridges and contributes to several strands of literature.

To start with, many important studies have focused on the origins of civil conflict (e.g., Skaperdas, 1992; Fearon, 1995; Gibbons, 2001; Powell, 2006; Dal Bó and Dal Bó, 2011; Besley and Persson, 2011a,b; Baliga and Sjöström, 2012, 2020; Svolik, 2012; Dippel, 2014; Bai and Jia, 2016; Harish and Little, 2017; Wang, 2017, 2021; Acharya, Harding and Harris, 2020; Amarasinghe, Raschky, Zenou and Zhou, 2020; Dippel and Heblich, 2021; Henn, Mugaruka, Ortiz, Sánchez de la Sierra and Wu, 2021; Mueller, Rohner and Schönholzer, 2022; surveys by Garfinkel and Skaperdas, 2007; Blattman and Miguel, 2010; Hoeffler, 2012). Another significant thread of literature has helped us understand political persecution and expropriation (e.g, Acemoğlu, Egorov and Sonin, 2008; Egorov and Sonin, 2015; Francois, Rainer and Trebbi, 2015; Diermeier, Egorov and Sonin, 2017). Our paper links these two research areas by analyzing the implications of persecution power on endogenous political contests for such power in a unified model.

Such analysis yields steps forward along several important strands of literature on political institutions and constitutional design. First, a few influential studies have focused on the coordination-facilitating role of institutions that constrain an autocrat's or the executive power (e.g., North and Weingast, 1989; Przeworski, 1991, 2006; Weingast, 1997; Fearon, 2011; Svolik, 2012); in particular, Myerson (2008) shows that a king may solve his commitment problem in front of his potential allies by establishing a council to help them coordinate a credible threat if commitments are not fulfilled. We shift the focus from coordination to the decision rule of such institutions, and our analysis shows that unanimity rule with

individual veto on executive matters has a unique advantage in conferring civil peace and preventing persecution in weakly institutionalized environments. This result helps explain why unanimity rule, despite often being criticized on the ground of efficiency (e.g., Aghion, Alesina and Trebbi, 2004; Persico, 2004; Harstad, 2005; Fukuyama, 2014), has been widely adopted among premodern democracies (e.g., Stasavage, 2020a) and political organizations within which persecution and conflict are of great concern, such as the leadership of the Chinese Communist Party (e.g., Shirk, 1993, 2018; Xie and Xie, 2017; Li, Roland and Xie, Forthcoming a).

Second, an organizing theme in the literature on endogenous constitutions is that to stabilize a policy-making rule, a more demanding decision rule is often required for constitutional change (e.g., Barbera and Jackson, 2004; Acemoğlu, Egorov and Sonin, 2012, 2015, 2021). Our analysis identifies a general environment where even unanimity rule for constitutional change may fail to stabilize a policy-making rule: in our model, given any non-unanimity, non-dictatorial rule as the default for executive action, if the king proposes dictatorship, the council may unanimously approve it. This is because both dictatorship and the default non-unanimity, non-dictatorial rule will induce an all-out contest for the kingship, while dictatorship maximizes the persecution power of the emerging king. Therefore, to stabilize a non-dictatorial rule, in addition to a demanding decision rule for constitutional change, other institutional safeguards must be provided.

Among the institutional safeguards we highlight is the careful design of agenda-setting power in constitutional conventions. In the literature, foundational works have noted the general inequality in agenda-setting power within political organizations (e.g., Dahl, 1956; Cox, 2006), and many studies have analyzed how agenda-setting power influences policy outcomes (e.g., Romer and Rosenthal, 1978; Cox, 2006; Diermeier and Fong, 2011; Tsebelis, 2003; Anesi and Seidmann, 2014; Gehlbach, 2013).[1] On endogenous constitutions, the aforecited literature often assumes away the importance of agenda-setting power by postulating that the constitutional convention can eventually vote on all possible constitutional proposals (e.g. Acemoğlu, Egorov and Sonin, 2012). We analyze instead the role of agenda-setting power in endogenous constitutions, and our analysis implies that it can determine the constitution in the long run. Both the focus of analysis and the implications are, to our knowledge, new to the literature.

---

[1]On the inequality in agenda-setting power, for example, Cox (2006, p. 142) recognizes that "while legislators are everywhere equal in voting power, they are everywhere unequal in agenda-setting power." Dahl (1956, p. 84) makes a similar point in his fourth condition of an ideal democracy: "[a]ny member who perceives a set of alternatives, at least one of which he regards as preferable to any of the alternatives presently scheduled, can insert his preferred alternative(s) among those scheduled for voting." Thus, the fourth condition is equality in agenda-setting power. Dahl (1956, p. 72) then asserts that "[i]n no organization of which I have any knowledge does the fourth condition exist."

The key role of agenda-setting power in constitutional design demonstrates the importance of separation of powers between the executive and legislative branches of government. The existing literature has understood that separation of powers can generally better align policy outcomes with voter preferences and thus improve political accountability (e.g., Persson, Roland and Tabellini, 1997, 2000; Persson and Tabellini, 2002; de Figueiredo, Jacobi and Weingast, 2006; Callander and Krehbiel, 2014). To our knowledge, we are the first in the literature to provide a formal framework to understand how an independent legislature helps preserve civil peace and affects the stability of different regimes, thus also bridging the literature on separation of powers with the literature on the foundations of self-enforcing or stable institutions (e.g., Przeworski, 1991, 2006; Weingast, 1997; Acemoğlu and Robinson, 2006, 2008; Fearon, 2011; Bidner and Francois, 2013; Bidner, Francois and Trebbi, 2015; Rantakari, 2021; surveys by Gehlbach, Sonin and Svolik, 2016; Svolik, 2019; Egorov and Sonin, 2020).

As agenda-setting power in constitutional design determines the constitution in the long run in our model, it also implies that an independent legislature can be more willing to temporally extend emergency power to the executive, increasing the emergency capacity of an executive that has been heavily constrained in normal times. Therefore, in a weakly institutionalized environment as in our model, only unanimous democracy with a fully independent legislature can *simultaneously* achieve civil peace and effective crisis management, besides protecting human rights at the individual level; by contrast, a dictatorship may handle crises well, but is incapable of conferring perpetual civil peace. These insights refute a long tradition in political theory that attempts to justify an absolute dictatorship by its supposed unique advantage in managing crises and maintaining order (e.g., Bodin, 1992; Hobbes, 1996; Schmitt, 1985, 2014), and provide instead an advantage to democratic institutions in the recent conceptual debate on regime types and crisis management (e.g., Agamben, 2005; Stasavage, 2020b; Qin, 2021; Li, Roland and Xie, Forthcoming b).

Last but not least, on the separation between the executive and judicial powers, a vast literature has highlighted benefits of judicial independence (e.g., Salzberger and Fenn, 1999; Hanssen, 2004; Maskin and Tirole, 2004; La Porta, López-de-Silanes, Pop-Eleches and Shleifer, 2004; Haggard, MacIntyre and Tiede, 2008; Melton and Ginsburg, 2014). Compared with the literature, we formalize the notion of judicial insulation, which concerns primarily the career paths of judicial members and is thus more demanding than the generic notion of judicial independence.

We show that a highly insulated judiciary within a socially cohesive elite circle helps prevent persecution and preserve civil peace. This result affirms the general importance of growing socioeconomic complexity, interconnectedness, and social cohesion brought by

economic development in achieving political stability (e.g., Cox, North and Weingast, 2019). At the same time, it contrasts a long tradition in political science and history that an independent judiciary is regarded as an obstacle to civil peace because it fragments political authority (e.g., Plumb, 1967, p. 189; Finer, 1997c, p. 1356). Finally, it suggests that the secure, sometimes life tenure of judicial members may help the judiciary function not only because it protects the judges from the executive's retaliation, which has been well recognized by the literature (e.g., Hanssen, 2004), but also because it insulates them from joining the executive in the future.

2 The Baseline Model

2.1 Setup

The model is an infinite-horizon dynamic game with discrete periods. There is a council that consists of $N \geq 3$ positions. One of the positions is the kingship, and the others $N-1$ ones are for ordinary council members. Figure 1 lays out the setup for each period t. We now introduce the setup in more details.

In the model, each period t inherits the king as well as $N-1$ ordinary council members who were in the council at the end of period $t-1$. Consistent with the setup below, each of the ordinary council members owns an asset, which can bring an exogenous, council-specific payoff $R > 0$ at the end of each period if she is still in the council at that time.

Each period t has a contest stage, followed by a persecution stage:

Contest stage. The $N-1$ ordinary council members first simultaneously choose whether or not to contest the kingship during period t.

If no ordinary council member contests, the incumbent king and all ordinary council members will remain in their positions and all ordinary council members' assets will remain untouched. The contest stage then ends there.

If at least one ordinary council member contests, first, the incumbent king will automatically respond to the challenge by participating in the contest.

Second, we assume that the contest is so destructive that it will destroy any assets of participants in the contest. Not only making the analysis simpler, this assumption captures the often enormous negative consequences of civil conflict; such consequences justify the interest of the literature in civil conflict (e.g., survey by Blattman and Miguel, 2010).

Third, we assume that the incumbent king will win the contest with probability $\Pi^K(Q_t) > 0$, and each contesting ordinary council member $\Pi^M(Q_t) > 0$, where $Q_t \in \{2, 3, \ldots, N\}$

- Council (king, $N - 1 \geq 2$ ordinary council members) inherited from $t - 1$

Contest stage

- Ordinary members simultaneously choose to contest kingship or not

- If no one contests, then everyone remains

- If some contest:

    - King dragged into contest, # of contestants (including king) $Q_t \geq 2$, their assets destroyed
    - King wins with probability $\Pi^K(Q_t) > 0$, each contesting ordinary member $\Pi^M(Q_t) > 0$, with $\Pi^K(Q_t) + \Pi^M(Q_t) \cdot (Q_t - 1) = 1$
    - Winner becomes king
    - Defeated get 0, exit, positions filled by newcomers with assets
    - Non-contesting ordinary members remain

Persecution stage

- King chooses # of ordinary members $p_t \in \{0, \ldots, N - 1\}$ to persecute

- If $p_t \geq 1$:

    - King pays infinitesimal cost $\epsilon > 0$, nature draws whom to persecute by equal probability
    - Ordinary council members vote sincerely on persecution
    - If $< e$ ordinary members vote against it, $e \in \{1, \ldots, N\}$:
        * King remains and gets $p_t \kappa R/(1 - \delta)$, with $R > 0$, $\kappa \in (0, 1)$, $\delta \in (0, 1)$
        * Persecuted get 0, exit, positions filled by newcomers with assets
        * Non-pesecuted and new ordinary members remain, each gets income R

- If $p_t = 0$, or if $p_t \geq 1$ but persecution proposal struck down by $\geq e$ ordinary members:

    - Everyone remains, each ordinary member gets income R, king 0.
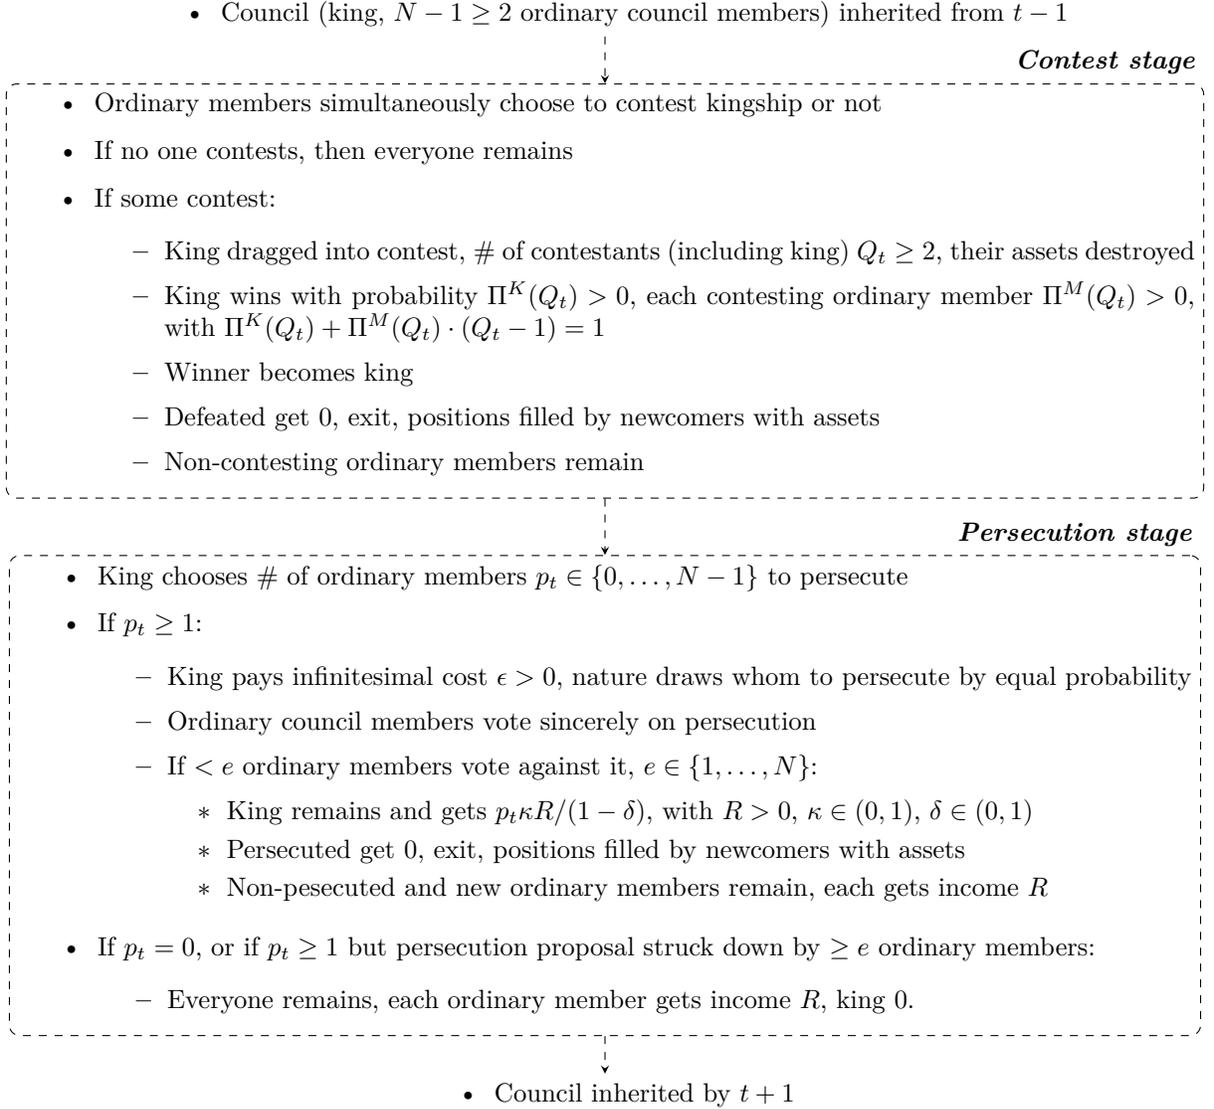

- Council inherited by $t + 1$

Figure 1: Setup of the baseline model, each period t

denotes the number of participants of the contest and the functions $\Pi^K(\cdot)$ and $\Pi^M(\cdot)$ are exogenous and satisfy $(Q_t - 1)\Pi^M(Q_t) + \Pi^K(Q_t) = 1$, i.e., each participant has a strictly positive chance to win and one and only one will eventually win. These assumptions are minimalistic, non-controversial, and less demanding than the standard assumptions in the contest literature (e.g., Skaperdas, 1996; Clark and Riis, 1998).

Finally, after the contest, the winner will become the new king, whereas the defeated participants will receive a zero payoff and be expelled from the council, i.e., exit the game, and the vacant ordinary positions in the council will be filled by newcomers, whose assets will deliver a council-specific flow payoff R if they can survive until the end of each period.[2] The

---

[2] This setting is similar to the *divide-et-impera* regime of leadership succession in Konrad and Skaperdas

ordinary council members who did not contest during this stage are to keep their positions in the council and have their assets untouched. The contest stage ends there.

When the contest stage ends, one enters the persecution stage of period t, inheriting the current king and $N-1$ ordinary council members:

Persecution stage. In the persecution stage, the current king can choose the number of current ordinary council members who he would like to persecute and expropriate, $p_t \in \{0, 1, \ldots, N-1\}$. If $p_t \geq 1$, the king must pay an infinitesimal cost ϵ for the proposal, and nature then randomly selects p_t current ordinary council members by equal probability among all possible combinations. This setting makes it impossible for the king at the contest stage to promise to spare a specific ordinary council member in the following persecution stage. We remark more on this setting below when introducing the solution concept we use and when discussing the current setup as being pro-persecution/contest.

Knowing the eventual proposal of persecution, which includes p_t ordinary council members, the council will meet to vote on it. To focus on more intuitive equilibria in our analysis, we assume that all ordinary council members vote sincerely, i.e., consider themselves to be pivotal when voting. This assumption is equivalent to assuming potentially strategic voters playing weakly undominated voting strategies between the two voting options, or stage-undominated strategies, which is standard in the literature (e.g., Gehlbach, 2013, p. 13–14; Dziuda and Loeper, 2016, p. 1154). We also assume that all ordinary council members will vote for the proposal if they are indifferent, which is standard in the literature, too (e.g., Acemoğlu, Egorov and Sonin, 2012, p. 1468; Diermeier, Egorov and Sonin, 2017, p. 856, 867–868).

These votes determine the fate of the proposal of persecution. It will be rejected if and only if at least e ordinary council members have voted against it, where the decision rule $e \in \{1, 2, \ldots, N\}$ is exogenous in the baseline model. If the proposal is rejected by the council, or if the current king did not propose to persecute anyone ($p_t = 0$), he and all current council members will remain in their positions. Since all ordinary council members' assets will remain untouched, they will deliver flow payoff R to their owners. About the king's payoff in this scenario, since we have assumed that any contest produces a king while destroying all contestants' assets, any king in this scenario, unless he is the very first king and has not experienced any contest, does not own any asset; if he is indeed the very first king and has not experienced any contest, for simplicity, we just assume that he does not own

---

(2007). We can microfound these elite entries by assuming that, if not in the council, the potential newcomers' assets will bring a flow payoff that is significantly lower than the council-specific flow payoff R. This assumption would be reasonable, considering that joining the king's council, even if it means to face political struggles and persecution, is still a great elevation in social status and expected wealth.

any asset. Therefore, the king in this scenario will receive a zero payoff; assuming instead that the first king owns an asset would not change the results of the model.[3] The persecution stage and also period t end there.

If the proposal is approved by the council, instead, the current king will persecute the current ordinary council members who are listed in the proposal, expropriate their assets, and expel them from the council. The latter will thus receive a zero payoff and exit the game, and the vacant ordinary positions in the council will be filled by additional newcomers, who will bring their own asset with them, which has the same potential to generate the council-specific flow per period payoff R.

After each expropriation of a persecuted council member, the king is assumed to automatically sell the expropriated asset in the market at a value of $\kappa \cdot R/(1-\delta)$, where $\delta \in (0,1)$ is the exogenous social discount factor, $R/(1-\delta)$ is the cash value of the expropriated asset in the market, and $\kappa \in (0,1)$ is exogenous and indicates the effectiveness of the expropriation and sale. Since p_t council members are to be persecuted, the current king will eventually receive a payoff of $p_t \cdot \kappa \cdot R/(1-\delta)$.[4]

Finally, the current ordinary council members who are not persecuted will keep their positions in the council, have their assets untouched, and thus receive the flow payoff R. The persecution stage and thus period t end there, period $t+1$ begins inheriting the current king and ordinary council members and things proceed like in period t.

Before completing the setup, several remarks can be made about the decision rule e.

Interpretation and enforceability of the decision rule e.   In the model, the parameter of paramount interest is e, i.e., the number of votes that the ordinary council members need to block the persecution. Since the king is the agenda-setter for executive actions, i.e., persecution in our model, not only does the parameter e define the council's decision rule, but it also represents the level of formal political authority in the political regime:

- At one end, when $e = 1$, the king must obtain unanimous approval of the council before implementing any executive actions. We will call this a regime of *unanimous democracy.* The word "democracy" here follows the original meaning of the Greek word *dēmokratía,* which concerns the ordinary council members' "capacity to do things,

---

[3]To see this point, given the rest of the setup, first note that at any persecution stage with the very first king, the income from his asset would appear in his payoff but not on the margin of his decision, so it would not make a difference in his decision. Second, in any contest stage with the very first king, the income from his asset would not appear in any ordinary members' payoff, because any contest over the kingship would destroy the asset. Therefore, the asset would not make a difference in such contest stages either.

[4]All results of the model will remain if we assume instead that the king keeps and holds a proportion of the expropriated assets, with an additional simplifying assumption that the king prioritizes persecuting the most senior ordinary council member, as we introduce in Section 4.1.

not majority rule" (Ober, 2008, p. 3); as noted by Stasavage (2020a, p. 4) and Ahmed and Stasavage (2020, p. 502), "seeking consent [is] a basic ingredient of" and "key to democracy."

- At the other end, when $e = N$, the $N - 1$ ordinary council members cannot block the king's initiative even if all of them vote against it. We will call this a *dictatorship* of the kingship.

- In between, when $e \in \{2, 3, \ldots, N-1\}$, a single ordinary council member cannot block the king, but a coalition of e ordinary council members can. This is thus a *collective veto regime* or *non-unanimous democracy,* for example, a majoritarian democracy if $e = \lfloor N/2 \rfloor + 1$, or a two-thirds democracy if $e = \lfloor N/3 \rfloor + 1$.

We have assumed e to be exogenous in the baseline model; we will focus on its role in the game in our analysis. That said, in Section 3, we endogenize it to analyze the transition and stability of political regimes.

One may wonder how the decision rule e and, more generally, any *publicly understood* rules, either formal or informal, including the institutional arrangements we analyze in Sections 3 and 4, can be enforced. On this issue, one can extend the argument in Fearon (2011) that these rules provide clear public signals for coordinating rebellion if they are violated. These rules can thus be self-enforcing.[5]

Complete the setup. To complete the setup of the baseline model, the initial period $t = 1$ inherits a king, who, as we have assumed, does not own any asset, and $N - 1$ ordinary council members as given. We assume that players in the game have an infinite horizon and maximize the net present value of their own expected payoffs using the social discount factor δ as their common personal intertemporal discount factor. In Section 2.2, we discuss the robustness of our baseline results if we allow the personal discount factor to differ from the social one.

Solution concept. When analyzing the model, we adopt pure-strategy Markov perfect equilibrium (MPE) as the solution concept. This rules out strategies that would require

---

[5]Closely related, one may also note that in our model, violence at the persecution stage is rule-based, since any persecution follows a publicly understood procedure and is subject to the council's vote with a given decision rule; violence at the contest stage is not, since any ordinary council member can initiate a contest and its result is determined randomly. Following the Weberian notion of legal authority, persecution in our model can thus be understood as *legitimate* violence, and contest *illegitimate* violence (Weber, 1978, p. 215, 217; Weber, 2004, p. 33–34). Therefore, our model provides a formal framework to analyze the relationship between the two.

additional institutional constraints besides the minimal ones of our setup. For example, it rules out the possibility for the king to promise at the contest stage that he will compensate or spare any non-contesting ordinary council members at the following persecution stage, because whether an incumbent ordinary council member at the persecution stage has contested or not is not payoff-relevant to the incumbent king when he chooses the length of his persecution proposal.[6] Together with the setting that nature randomly fills ordinary council members into the slots of persecution, adopting the MPE as the solution concept captures the significant commitment problems the king would face in a weakly institutionalized environment (e.g., Acemoğlu, 2003; Myerson, 2008, 2015; Egorov and Sonin, 2011; Ma and Rubin, 2019), ruling out strategies that would suffer from such problems.

Current pro-persecution/contest setup and solution concept. One may propose a few alternative settings or solution concepts to what we have introduced. For example, first, the persecution stage may start with the king himself nominating the ordinary members to be persecuted, instead of him choosing only the length of the persecution list while nature filling the list randomly. Second, when indifferent, the ordinary members may vote against, rather than for, the persecution proposal. Finally, instead of focusing only on Markov strategies in the current setup, one may consider non-Markov strategies, which may involve some forms of contracts, or create an additional stage in each period in which the king can spare or punish ordinary members depending on their past behaviors. Compared with these alternatives, our current setup and solution concept prevent the king from credibly contracting with ordinary council members with conditional sparing and thus, as we will show below, makes him less capable of preventing them from contesting the kingship. Being pro-persecution/contest, our current setup with the focus on MPEs can thus serve as a stress test for institutions, helping us understand how robustly different institutional arrangements could prevent political purges and civil conflict.

2.2 Analysis and Results

We first analyze the persecution stage for each period t:

Lemma 1 (Persecution stage)**.** *Given any decision rule of the council $e \in \{1, 2, \ldots, N\}$, in any MPE, at each persecution stage, the king will propose to persecute $p_t = e - 1$ ordinary*

---

[6]Even if we allowed the king to do so, he would not be able to implement such contracts with many ordinary council members, because the more ordinary members he makes promises to, the fewer ordinary members he will be able to persecute later, and the smaller his budget that he can use to fulfill the promises. In the extreme case, if he made promises to all ordinary members, then he would not be able to keep his promise at all, since the contracts would not allow him to persecute anyone and he would have no expropriated resources to pay the ordinary members back.

council members, and the council will approve this proposal.

We prove Lemma 1 in Appendix A. The intuition of Lemma 1 is simple. Since whether a persecution proposal gets approved or rejected only matters to those ordinary council members whose names are on the list, any persecution proposal will be supported by and only by ordinary council members whose names are not on the list. Therefore, given the council's decision rule e, on the one hand, the king cannot persecute more than $e-1$ ordinary members, because at least e ordinary members will vote against such a proposal and thus reject it; on the other hand, if persecuting fewer than $e-1$ ordinary members, the king will leave a payoff of at least $\kappa R/(1-\delta) > 0$ on the table, which he could have received if he had proposed to persecute an additional ordinary member, which would have been approved by the council. The king will thus choose to persecute exactly $e-1$ ordinary members, i.e., the greatest number of persecutions that he can get approved by the council.

Given this result about the persecution stage, we can derive our baseline results about how the council's decision rule e determines the equilibrium of the model:

Proposition 1 (Hobbesian wars under any non-unanimity rule.). *Given any non-unanimity rule of the council, i.e., $e \in \{2, 3, \ldots, N\}$, as $\delta \to 1$, there exists a unique MPE, in which all ordinary council members at each contest stage will contest the kingship; at each persecution stage, the king will propose to persecute $e-1$ ordinary members, and the council will approve the proposal.*

We prove Proposition 1 in Appendix B. The intuition is as follows. First, examine whether the proposed strategies constitute an MPE. Note that staying on the conjectured equilibrium path contesting in the current period will bring an ordinary council member the expected value of

$$V^M = \frac{\Pi^M(N)}{1 - \delta\Pi^K(N)} \cdot \frac{(e-1)\kappa R}{1-\delta}, \tag{1}$$

where $\Pi^M(N)$ is the probability for her to become the king given that everyone else is contesting the kingship, $\Pi^K(N)$ is her probability to survive in each future contest as the king, and $(e-1)\kappa R/(1-\delta)$ is her expropriation profit as the king in each period, given that Lemma 1 suggests that she will expropriate $e-1$ ordinary council members. At the same time, a single deviation, under which she unilaterally does not contest for now, will bring her

$$V' = \frac{N-e}{N-1} \cdot \left(R + \delta \cdot V^M\right), \tag{2}$$

where $(N-e)/(N-1)$ is her probability to be spared in the following persecution stage and thus have an opportunity to contest later, R is the safe return from her asset if she is spared, and V^M has been defined above.

Now compare the two options. Under any non-unanimity rule, i.e., $e \geq 2$, given Lemma 1, in each persecution stage someone has to be persecuted; because of the nature of Markov strategies, no one can credibly commit to spare anyone in the following persecution stage even conditional on her behavior at the contest stage. Therefore, even under the single deviation, the ordinary council member may still be persecuted, i.e., $(N - e)/(N - 1) < 1$. This risks her future opportunity to contest the kingship, which values V^M. If this opportunity is sufficiently valuable, for example, if the social discount factor goes to one, i.e., $\delta \to 1$, such that the expropriation profit per period of a king becomes extremely high, i.e., $(e-1)\kappa R/(1-\delta) \to \infty$, and so does the value of the opportunity to contest the kingship, i.e., $V^M \to \infty$, the single deviation will make the ordinary member much worse, rather than better, off, i.e.,

$$V^M - V' = \left(1 - \frac{N - e}{N - 1} \cdot \delta\right) \cdot V^M - \frac{N - e}{N - 1} \cdot R \to \infty \quad \text{as} \quad \delta \to 1. \tag{3}$$

The strategies in Proposition 1 thus constitute an MPE.

Second, examine whether some alternative Markov strategies can constitute an MPE. Given any non-unanimity rule, by Lemma 1, again, no Markov strategies could spare an ordinary council member from persecution for not contesting the kingship. This ordinary council member's expected payoff under any alternative Markov strategies would thus be bounded. At the same time, since contesting will give her a chance to grab the persecution power of the kingship, which will become extremely lucrative if the social discount factor goes to one, she will be better off if she just contests now. Therefore, any alternative Markov strategies cannot constitute an MPE.

Two remarks are in order on the role of the social discount factor in Proposition 1:

Social discount factor rising toward one. One may wonder why we have focused on the scenario where the social discount factor tends toward one. This is because we would like to explore how robustly each decision rule of the council could avoid all-out contests when a lucrative political authority is present. This will also strengthen the robustness of our analysis in Sections 3 and 4, where we will explore how society can reform political institutions so that all-out contests would not feature in equilibrium.

Social and personal discount factors. Since we use the same parameter δ for both the social discount factor and the players' personal discount factor, we would like to clarify their different roles in Proposition 1. First, as discussed above, the proposition is driven primarily by the fact that each ordinary member is vulnerable to persecution, and then by

the possibility that the value of expropriated assets in the market will become extremely high when the social discount factor rises toward one. The players' personal discount factor has no role to play here, and Proposition 1 will still hold if we denote the players' personal discount factor as a separate parameter, for example, $\beta \in (0, 1)$, and take it as given.[7]

Second, note that if the players' personal discount factor rises, given the payoff from staying on the conjectured equilibrium path by always contesting (V^M), the payoff from deviating by not contesting for now (V') will increase, making the contest option less appealing. Therefore, we can read Proposition 1 as a strong result that, given any non-unanimity rule of the council, when the social discount factor rises toward one, even if the players' personal discount factor also rises at a similar pace, all ordinary council members will still contest the kingship at each contest stage.

The intuition of Proposition 1 also suggests that only unanimity rule $(e = 1)$ can escape from perpetual all-out contests for the kingship. This is because, by Lemma 1, it is only under unanimity rule that the king is not capable of persecuting or expropriating any ordinary council members, all ordinary members are thus not vulnerable to persecution; at the same time, the kingship thus becomes worthless. Therefore, no ordinary council member would contest it. This sharp discontinuity between $e = 1$ and $e \geq 2$ is established by the following proposition and proven in Appendix C:

Proposition 2 (Civil peace under unanimity rule)**.** *Under unanimity rule of the council, i.e., $e = 1$, there exists a unique MPE, in which all ordinary council members at each contest stage will not contest the kingship; at each persecution stage, the king will not propose to persecute any ordinary members, and the council would reject persecuting any ordinary members.*

Putting Propositions 1 and 2 together, our baseline results imply that, in weakly institutionalized environments, any non-unanimous political regimes, i.e., $e \geq 2$, without additional institutional safeguards that we will analyze in Sections 3 and 4, cannot preempt the risk of eventually falling into perpetual Hobbesian wars "of all against all" for the executive power, i.e., all ordinary council members at each contest stage contesting the kingship. This grim prediction applies not only to dictatorship $(e = N)$, but also to majority $(e = \lfloor N/2 \rfloor + 1)$

---

[7]When denoting the personal discount factor as β and taking it as given, we can derive a few additional comparative statics results. For example, the threshold of δ above which perpetual all-out contests can feature in equilibrium is decreasing in $e \in \{2, \ldots, N\}$, and it does not exist when $e = 1$, i.e., weaker authority of the king makes it more difficult for perpetual all-out contests to feature in equilibrium, whereas the possibility vanishes when the king has no authority, consistent with Proposition 1 and 2. To see this result, observe that by Equations (1) and (2), the critical threshold $\bar{\delta}$ is defined by $V^M - V' = 0$, i.e., $\left(1 - \frac{N-e}{N-1} \cdot \beta\right) \cdot \Pi^M(N) / \left(1 - \beta \Pi^K(N)\right) \cdot (e-1)\kappa R / \left(1 - \bar{\delta}\right) - \frac{N-e}{N-1} \cdot R = 0$; the left-hand side of the equation is increasing in δ and e, and the equation cannot hold when $e = 1$.

and super-majority rules ($2 \leq e < \lfloor N/2 \rfloor + 1$), and any other collective veto regimes or non-unanimity rule ($\lfloor N/2 \rfloor + 1 < e < N$). Unanimous rule with veto power of each single stakeholder thus has an unique advantage in securing civil peace in such environments. We will discuss this implication in more details in Section 5.1.

3 Endogenous Dynamics of the Decision Rule

Since the council's decision rule e is exogenous in the baseline model, it is unclear whether or not it can be stable over time and thus keep its advantage over other regimes in securing civil peace. If the council can choose its own decision rule periodically, which decision rule will be stable, and under what institutional conditions?
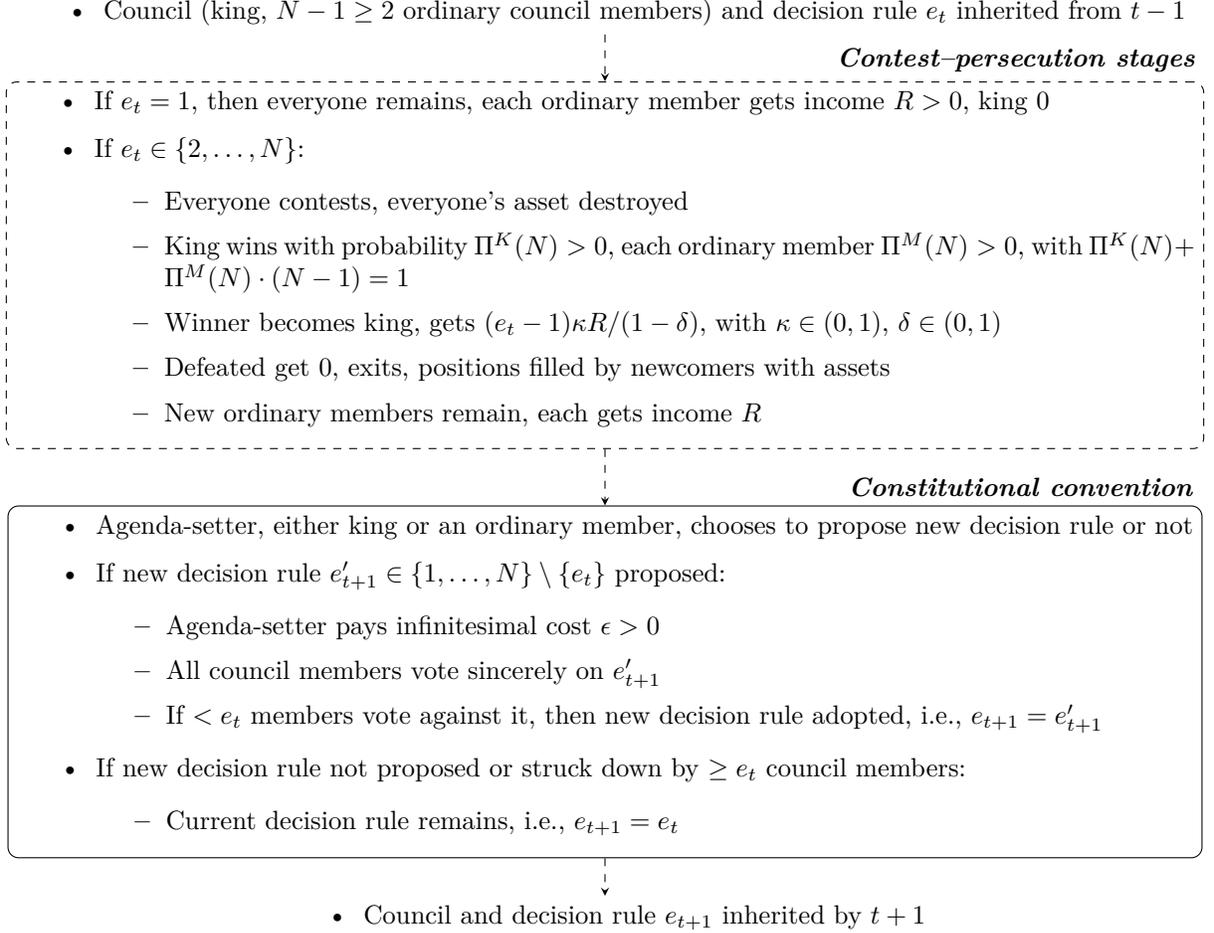

3.1 Setup

As laid out in Figure 2, we introduce a constitutional convention to the end of each period, after the contest and persecution stages. In each constitutional convention, an agenda-setter can propose, at an infinitesimal cost $\epsilon > 0$, to revise the council's decision rule into $e'_{t+1} \in \{1, 2, \ldots, N\} \setminus \{e_t\}$. About the identity of these agenda-setters, when we say that the agenda-setting power lies in the kingship, we mean that in each constitutional convention, the king at that time sets the agenda; when we say that the agenda-setting power lies in the council, we mean that the agenda-setter in each constitutional convention is an ordinary council member. After a decision rule is proposed, the council will vote sincerely on it, following the current decision rule e_t. If the proposal is approved, the council adopts it as its decision rule in the next period, $e_{t+1} = e'_{t+1}$; if the agenda-setter does not propose or if the proposal is rejected by the council, then the current decision rule remains, i.e., $e_{t+1} = e_t$.

We focus on the dynamics, i.e., transition and stability, of the decision rule in equilibrium, and how the dynamics will depend on where the agenda-setting power on constitutional matters lies. Given our focus, we simplify the contest and persecution stages by assuming that all players mechanically follow the strategies in the baseline results, i.e., Propositions 1 and 2: if the current decision rule is unanimous ($e_t = 1$), then there will be no contest or persecution; if it is non-unanimous ($e_t \geq 2$), then all ordinary council members contest at the contest stage and $e_t - 1$ members are persecuted in the persecution stage.[8]

Decision rules in constitutional conventions and their enforceability. We have assumed that each constitutional convention adopts the same decision rule as the council at

---

[8]We can microfound this simplification by keeping the contest and persecution stages fully endogenous, but that would make the proofs much longer without bringing many additional insights.

- Council (king, $N - 1 \geq 2$ ordinary council members) and decision rule e_t inherited from $t - 1$

Contest–persecution stages

- If $e_t = 1$, then everyone remains, each ordinary member gets income $R > 0$, king 0

- If $e_t \in \{2, \ldots, N\}$:

  - Everyone contests, everyone's asset destroyed
  - King wins with probability $\Pi^K(N) > 0$, each ordinary member $\Pi^M(N) > 0$, with $\Pi^K(N) + \Pi^M(N) \cdot (N - 1) = 1$
  - Winner becomes king, gets $(e_t - 1)\kappa R/(1 - \delta)$, with $\kappa \in (0, 1)$, $\delta \in (0, 1)$
  - Defeated get 0, exits, positions filled by newcomers with assets
  - New ordinary members remain, each gets income R

Constitutional convention

- Agenda-setter, either king or an ordinary member, chooses to propose new decision rule or not

- If new decision rule $e'_{t+1} \in \{1, \ldots, N\} \setminus \{e_t\}$ proposed:

  - Agenda-setter pays infinitesimal cost $\epsilon > 0$
  - All council members vote sincerely on e'_{t+1}
  - If $< e_t$ members vote against it, then new decision rule adopted, i.e., $e_{t+1} = e'_{t+1}$

- If new decision rule not proposed or struck down by $\geq e_t$ council members:

  - Current decision rule remains, i.e., $e_{t+1} = e_t$

- Council and decision rule e_{t+1} inherited by $t + 1$

The solid frame indicates new elements to the baseline setup (Figure 1). The contest–persecution stages are simplified following Propositions 1 and 2.

Figure 2: Setup for endogenous council decision rule, each period t

the persecution stage in the same period, e_t. This contrasts with the literature showing that, to stabilize a policy-making constitution, a much more demanding decision rule for constitutional change is required, i.e. unanimous or super-majoritarian voting for constitutional change versus majoritarian voting in policy-making (e.g., Barbera and Jackson, 2004; Acemoğlu, Egorov and Sonin, 2021). Since we have assumed sincere voting, all ordinary council members in a constitutional convention will cast the same vote on the same constitutional proposal, and the voting result under the decision rule e_t thus always follows the preference shared by all ordinary council members in the constitutional convention. Therefore, the results of this extension remain robust if we assume a more demanding decision rule in the constitutional convention, for example full unanimity when the king is the agenda-setter of the convention, or near unanimity except the king when an ordinary council member is the agenda-setter.

One may also wonder how, within each constitutional convention, the decision rule e_t, or the full or almost unanimity rule just mentioned above, is enforced. On this issue, besides the argument following Fearon (2011), which we have discussed in Section 2.1, note again that the voting result under the decision rule always follows the preference shared by all ordinary council members in the constitutional convention. Since they compose a broad coalition of $N-1$ members, while if a different opinion exists, it is supported by at most one council member, i.e., the king, the different opinion will be too weak to dominate the broad coalition or overthrow the voting result. Following the spirit of Przeworski (1991, 2006), the decision rule is thus self-enforcing.

3.2   Analysis and Results

The first step in our analysis is to show that the unanimous decision rule is stable:

Lemma 2 (Stability of unanimity rule). *Regardless of who has the agenda-setting power in constitutional conventions, in any MPE, if the current decision rule is unanimity rule, then the agenda-setter will not propose to change it, and if the agenda-setter did propose to change it, then all ordinary council members would vote against the proposal. Unanimity rule is thus stable, i.e., if $e_t = 1$, then $e_{t+1} = 1$.*

We prove Lemma 2 in Appendix D. The intuition is as follows. On the one hand, given the strategies in Lemma 2, the agenda-setter has no incentive to unilaterally propose a change, knowing it will be rejected, given that proposing an alternative decision rule is costly. For any proposal, ordinary council members will not approve it either, since, following the strategies in Lemma 2, unanimity rule guarantees safe returns from one's own asset forever $R/(1-\delta)$, while switching to a non-unanimous decision rule brings the opportunity to expropriate others, which will bring an expected payoff of at most $\frac{\Pi^M(N)}{1-\Pi^K(N)} \cdot (N-1) \cdot R/(1-\delta)$, and this upper bound comes from supposing that the emerging king would be a dictator who is able to expropriate everyone else, that he would not discount future payoffs, and that the expropriation would be perfectly efficient. Since there is one and only one winner in each contest, i.e., $\Pi^M(N) \cdot (N-1) + \Pi^K(N) = 1$, however, when everyone will fight against everyone under any non-unanimity rule, the opportunity to expropriate others would still be too uncertain, i.e.,

$$\frac{\Pi^M(N)}{1 - \Pi^K(N)} = \frac{1}{N-1},$$

(4)

for even the upper bound of its value to dominate the safe returns under unanimity, i.e.,

$$\frac{\Pi^M(N)}{1 - \Pi^K(N)} \cdot (N-1) \cdot \frac{R}{1-\delta} = \frac{R}{1-\delta}.$$

(5)

Therefore, the strategies in Lemma 2 can be part of an MPE.

On the other hand, for any alternative Markov strategies that would lead to unanimity rule being replaced, any single ordinary council member can be better off by unilaterally blocking the proposal and thus bringing civil peace and a safe return from her own asset for one additional period. Therefore, any MPE cannot include any alternative Markov strategies to the ones in Lemma 2.

Lemma 2 suggests that unanimity rule is an absorbing state in equilibrium. This helps us fully identify the dynamics of the decision rule when the kingship has the agenda-setting power in constitutional conventions, the case we examine first:

Proposition 3 (Regime dynamics when the kingship controls the constitutional agenda). *If the agenda-setting power in constitutional conventions lies in the kingship, then in any MPE, unanimity rule is stable; dictatorship is stable, too; any non-unanimity, non-dictatorial rules will transition instantly to dictatorship, i.e., if $e_t = 1$, then $e_{t+1} = 1$; if $e_t \geq 2$, then $e_{t+1} = N$.*

We prove Proposition 3 in Appendix E. In Proposition 3, the stability of unanimity follows Lemma 2. The intuition for the stability of dictatorship and the transition of any other non-unanimity rules to dictatorship is as follows. First, observe that the king and all ordinary council members in a constitutional convention prefer dictatorship ($e_{t+1} = N$) to any non-unanimity, non-dictatorial rules ($2 \leq e_{t+1} \leq N-1$). This is because all these non-unanimity rules will lead to an all-out contest for the kingship; among them, it is under dictatorship that the emerging king can persecute and expropriate the greatest number of ordinary council members, $N - 1$.

Second, observe that, when the current decision rule is non-unanimous, the king also prefers any non-unanimity rules ($e \geq 2$) to unanimity rule ($e = 1$). This is because, when the current decision rule is non-unanimous, the king at the constitutional convention must have emerged from an all-out contest in the preceding contest stage and have had his asset destroyed. Therefore, he will not benefit from the civil peace brought by a unanimity rule in the future, but will welcome the opportunity under a non-unanimity rule to persecute and expropriate.[9]

Given the two points above, we see that when the current rule is non-unanimous, the king's favorite rule is thus dictatorship. If the current rule is indeed dictatorship, then the

---

[9]One may find in Weber (2004, p. 86, 90) the intuition that experience of violence drives political agents into a preference for destructive power: "whoever becomes involved with politics, that is to say, with power and violence as a means, has made a pact with satanic powers," and "[a]nyone who wishes to engage in politics at all, and particularly anyone who wishes to practice it as a profession, must become conscious of these ethical paradoxes and of his own responsibility for what may become of *him* [that] he is entering into relations with the satanic powers that lurk in every act of violence."

king will thus not propose to change it. Dictatorship is thus stable when the kingship holds the agenda-setting power.

Finally, note that the default decision rule in the future is the current rule. Therefore, if the current decision rule is non-unanimous but non-dictatorial, and if dictatorship is proposed, which is indeed the king's favorite, then the council will compare dictatorship with an non-unanimity, non-dictatorial rule. Given the first point above, the council will thus approve the proposal for dictatorship. Therefore, any non-unanimity, non-dictatorial rule will transition instantly to dictatorship when the kingship holds the agenda-setting power.

In the intuition of Proposition 3, it is notable that, if the current decision rule is non-unanimous and if the kingship holds the agenda-setting power, ordinary council members' preference for unanimity rule does not matter. This is because the default option is a non-unanimity rule and the king will not propose unanimity rule.

One can imagine that this will not be the case if the agenda-setting power lies instead in the council. In that scenario, the future decision rule will be determined by the ordinary council members' preference about the decision rules, and they do prefer unanimity rule to any non-unanimity rules: as mentioned in the intuition of Lemma 2, unanimity brings them perpetual peace with safe returns from their assets, whereas the opportunity to persecute and expropriate others under any non-unanimity rule is too uncertain when everyone will be against everyone under an non-unanimity rule, even if the power to persecute and expropriate is as great as in dictatorship. Therefore, if the council holds the agenda-setting power in constitutional conventions, any non-unanimity rule will transition instantly to unanimity rule. This intuition is established by the following proposition and proven in Appendix F:

Proposition 4 (Regime dynamics when the council controls the constitutional agenda)**.** *If the agenda-setting power in constitutional conventions lies in the council, then in any MPE, unanimity rule is stable, and any non-unanimity rule will transition instantly to unanimity, i.e., for any $e_t \in \{1, 2, \ldots, N\}$, $e_{t+1} = 1$.*

Putting Propositions 3 and 4 together, Table 1 summarizes the stability and transition of decision rules and political regimes in equilibrium. As shown in the table, any non-unanimity, non-dictatorial rule is unstable; whether dictatorship can be a stable alternative to unanimity rule, and which stable regime a non-unanimity, non-dictatorial rule will transition into, depend on where the power to set the constitutional agenda lies. We discuss the implications of the results in Section 5.2.

Among the implications are two corollaries that are straightforward yet have important theoretical and historical relevance. Here we lay out them formally. The first concerns when an exogenous shock happens to the decision rule. For example, a small group of

Table 1: Regime dynamics in equilibrium

Agenda-setting power on constitutional issues	Kingship	Council
Unanimous democracy, $e_t = 1$	↺	↺
Collective veto regimes or non-unanimous democracies, $e_t \in \{2, 3, \ldots, N-1\}$	↓	↑
Dictatorship, $e_t = N$	↺	

Summary of Propositions 3 and 4. When the kingship holds the agenda-setting power on constitutional issues, it is always the king at the time who sets the agenda in each constitutional convention; when the council holds the agenda-setting power on constitutional issues, it is always an ordinary council member at the time who sets the agenda in each constitutional convention. Self-pointing arrows indicate stability; straight arrows indicate directions of transition.

people may have staged a coup and justified their temporary rule within the regime; facing a military crisis, a non-dictatorial regime may have granted more emergency power to the chief executive; under certain pressure, a dictatorial king may have had to concede more decision rights to other elites. Under these circumstances, how would a regime respond and evolve over time?

Corollary 1 (Resilience to institutional shocks). *Faced with exogenous shocks to the decision rule away from dictatorship $e_{t+1} = N$ or unanimity rule $e_{t+1} = 1$, if the kingship holds the agenda-setting power on constitutional issues, the regime will always end up in dictatorship; if the council holds the agenda-setting power instead, unanimity rule will eventually prevail.*

Corollary 1 suggests that although both dictatorship and unanimity rule can be stable, whether they are resilient to institutional shocks depends on where the power to set the constitutional agenda lies.

The second corollary concerns more specifically when the shock is an emergency that requires temporary dictatorial power. Heuristically, for any non-dictatorial regime, when an emergency requires temporary dictatorial power to be extended, if the king will always set the constitutional agenda in the future, then, by Proposition 3, the council will be worried

that a temporary extension would eventually become permanent, thus reluctant to approve such extension. This weakens the emergency capacity of the regime. If the agenda-setting power is always held by the council instead, by Proposition 4, the council will be confident of switching back to unanimity rule after the emergency, thus more willing to approve the extension. This makes the regime capable of responding to emergencies. We summarize this point as follows.

Corollary 2 (Emergency capacity)**.** *For any non-dictatorial regime, its emergency capacity depends on where the agenda-setting power on constitutional issues lies: it is strong if the power lies in the council, and weak if the power lies in the kingship.*

More discussion on the relevance of Corollaries 1 and 2 to political theory and history is provided in Section 5.2.

4 Persecution-overseeing Judiciary, Social Cohesion, and Judicial Insulation

Underlying all results in Sections 2 and 3 is the mechanism that persecution power of the kinship will attract all-out contests for such power. It is thus natural to ask: how would a judiciary that oversees persecution alter the relationship between the decision rule of the executive council and civil conflict? In particular, under what conditions can the judiciary robustly prevent persecution and thus avoid contests for the kingship?

4.1 Setup

To answer the questions, we modify our baseline model by introducing a judiciary of $\bar{N}$ judges, where $\bar{N} \geq 1$ is exogenous. The judges' job is, at each persecution stage, to evaluate and vote sincerely on any persecution proposal that has been approved by the executive council. The proposal will not be implemented if at least $\bar{e}$ judges vote against it, where $\bar{e} \in \{1, 2, \ldots, \bar{N}\}$ is exogenous too. Like in the baseline model, we assume that the judges vote for the proposal if indifferent, another standard and pro-persecution/conflict assumption. Figure 3 explains our setup.

Features of the judiciary. To explore under what conditions the judiciary can robustly prevent persecution and thus avoid contests for the kingship, several features in the functioning of the judiciary are important.

- Council (king, $N - 1 \geq 2$ ordinary members), judiciary ($\bar{N} \geq 1$ judges, among them $w \in \{1, \ldots, \min\{N, \bar{N}\}\}$ political, $\bar{N} - w$ non-political), elites' connection status $\theta_t \in \{0, 1\}$, and potential returns $\{R_{i,t-1}\}$ to elites' assets inherited from $t - 1$

Contest stage

- Same as in baseline setup (Figure 1), plus $\Pi^K(N)/\Pi^M(N) \leq \Pi^K(2)/\Pi^M(2)$
- Positions of defeated filled by new elite members with assets, potential return $R_{i,t-1} \equiv R > 0$

Persecution stage with judiciary

- King chooses # of ordinary members $p_t \in \{0, 1, \ldots, N - 1\}$ to persecute
- If $p_t \geq 1$:
  - King pays infinitesimal cost $\epsilon > 0$, nature draws p_t ordinary members (set P_t) to persecute[†]
  - King proposes transfer $T_{it} \geq 0$ to each judge, subject to budget $\sum_{i \in P_t} \frac{\kappa R_{i,t-1}}{1-\delta}$[‡]
  - Ordinary mermbers vote against persecution if and only if they are to be persecuted
  - If $< e$ ordinary members vote against it, $e \in \{2, \ldots, N\}$, then judges vote sincerely on it:
    * If $< \bar{e}$ judges vote against it, $\bar{e} \in \{1, 2, \ldots, \bar{N}\}$:
      · King remains and gets $\kappa \cdot \sum_{i \in P_t} R_{i,t-1}/(1 - \delta)$, with $\kappa \in (0, 1)$, $\delta \in (0, 1)$
      · Non-persecuted and judges remain, each gets $R_{it} = (1 - cp_t\theta_t)\, R_{i,t-1}, \; c > 0$
      · Each judge gets T_{it} from king if having voted for persecution
      · Persecuted get 0, exit, positions filled by new elite members with assets, each of whom gets $R_{it} \equiv R$
- If $p_t = 0$, or if $p_t \geq 1$ but struck down by $\geq e$ ordinary members or $\geq \bar{e}$ judges:
  - Everyone remains, each ordinary member/judge gets $R_{it} = R_{i,t-1}$, king 0

Membership and connection status update

- With probability $z \in (0, 1)$:
  - Nature retires w ordinary members by equal probability with safe return R_{it} forever
  - Council positions filled by political judges
  - Judicial positions filled by new elite members with assets, potential return $R_{it} \equiv R$
- With probability $1 - z$, no one retires
- Connection status $\theta_{t+1} = 1$ if no contest or persecution has ever happened by now, 0 if otherwise

- Council, judiciary, connection status θ_{t+1}, and potential returns $\{R_{it}\}$ inherited by $t + 1$

Solid frames indicate new structures to the baseline setup (Figure 1). Ordinary members' voting decisions on persecution are simplified following Lemma 1. [†]: if a unique most senior ordinary member exists, first draw her, then $p_t - 1$ from the other $N - 2$ ordinary members by equal probability; if otherwise, draw p_t from $N - 1$ by equal probability. [‡]: the king prioritizes judges who have been offered a strictly positive amount before.

Figure 3: Setup that incorporates a persecution-overseeing judiciary, each period t

First, we allow the judges' judicial decisions to be relevant to their own welfare, by assuming that persecution will incur a negative externality among the elites, i.e., the members of the executive council and the judiciary. In terms of the model, we assume that the asset of each non-persecuted ordinary member and judge will be damaged by persecution of others in period t so that it will generate a flow payoff of only

$$R_{it} = (1 - cp_t\theta_t) \cdot R_{i,t-1} \tag{6}$$

at the end of the persecution stage. In this expression, i denotes each individual non-persecuted ordinary council member or judge; $R_{i,t-1} > 0$ is the potential flow payoff of the local elite's asset until the current persecution decision, and the whole game starts from $R_{i,0} = R$ for all ordinary members and judges. The externality of persecution, if it exists, depends on the number of ordinary council members the king proposed to persecute, p_t, and the exogenous degree of potential *social cohesion* among the elites, $c > 0$. The externality is assumed to kick in only when the elites have been connected with each other in period t, i.e., $\theta_t = 1$, while $\theta_t = 0$ when otherwise. We assume that these connections among elites are vulnerable to contests and persecution of elite members, and also that such connections are difficult to reestablish, i.e.,

$$\theta_{t+1} = \begin{cases} 1, & \text{if no contest or persecution has ever happened by period } t; \\ 0, & \text{if otherwise.} \end{cases} \tag{7}$$

By making $\theta_t = 0$ an absorbing state, we capture the fragility of social connection when civil conflict and political violence pervade. This assumption also makes our analysis easier.

Second, we allow for a career path from the judiciary to the executive council, i.e., we assume that among the $\bar{N}$ judges there are w "political" ones, where $w \in \{1, 2, \ldots, \min\{N, \bar{N}\}\}$ is exogenous; after each persecution stage, with an exogenous probability $z \in (0, 1)$, nature will retire w ordinary council members with equal probability, letting them exit the game with their assets' flow payoffs from then on, and these positions are filled by the w political judges.[10] The number of "non-political" judges, i.e., $\bar{N} - w$, thus measures *judicial insulation* against the executive council in terms of the judges' career paths.

Third, we allow all judges to be influenced by the king, i.e., we assume that the king can commit to a transfer $T_{it} \geq 0$ within the persecution stage to each judge i for her vote in favor

---

[10]We can microfound these political judges entering the council by assuming that the potential flow return of their assets would be ϕR instead if they stayed in the judiciary, where $\phi \geq 0$. They would thus be willing to join the council whenever there is a vacancy, as long as ϕ is sufficiently low; in that case all results in this section would go through qualitatively.

of the persecution proposal. One may find this feature slightly inconsistent with the baseline model, in which the king cannot credibly contract with ordinary council members between the persecution and contest stages. That said, since this feature makes it more difficult for the judiciary to prevent persecution, given that the objective of our analysis is to explore under what conditions the judiciary can robustly prevent persecution, it will make the result of our analysis in this section more robust.

Furthermore, the total amount of transfers must be subject to a budget constraint, which is the persecution profit if the persecution proposal is approved by the judiciary, i.e., $\sum_{i \in P_t} \kappa R_{i,t-1}/(1-\delta)$, where $i \in P_t$ now denotes each ordinary council member on the persecution list. Moreover, we assume that when choosing the judges who receive strictly positive transfers, the king prioritizes the judges who have been offered strictly positive transfers before. This assumption captures the idea that exerting influence relies on relationships that are costly to build; it also makes the model more tractable in analysis.

Key assumption. We assume that in a contest for the kingship, the king's advantage relative to a contesting ordinary council member is not greater when the contest features more participants; in particular, the king's advantage in an all-out contest is not greater than in a duel, i.e., $\Pi^K(N)/\Pi^M(N) \leq \Pi^K(2)/\Pi^M(2)$. This assumption suggests that an ordinary council member's disadvantage as an ordinary council member in a duel now would be significant, while her advantage as a king in an all-out contest in the future would be insignificant. We find this assumption intuitive, since in an all-out contest the king is essentially one among many, whereas in a duel his relative status as the king is much more prominent. Moreover, this assumption holds naturally when the contest success functions follow an additive specification, which is the most widely used in the contest literature and axiomatized by Skaperdas (1996), with exogenous contest efforts of all participants and symmetric efforts among all contesting ordinary council members.[11]

Further simplifications. We impose two additional assumptions that simplify the model without sacrificing much in insights. First, we assume that all ordinary council members mechanically following Lemma 1 when facing a persecution proposal, i.e., they vote against it if and only if they themselves are to be persecuted. This assumption allows us to focus on the judiciary's decision and thus brings simplicity. We could keep these voting decisions in the executive council fully endogenous, but that would not bring many additional insights.

---

[11]The king's advantage relative to a contesting ordinary council member, $\Pi^K(Q)/\Pi^M(Q)$, would then be an exogenous constant, independent of the number of participants, Q. Mathematically, suppose that $\Pi^K(Q) \equiv K/\big((Q-1)M + K\big)$ and $\Pi^M(Q) \equiv M/\big((Q-1)M + K\big)$, where $M > 0$ and $K > 0$ are exogenous. The king's advantage is thus $\Pi^K(Q)/\Pi^M(Q) = K/M$.

Second, we assume that the king prioritizes persecuting the most senior ordinary council member: if there exists a unique most senior ordinary member, when drawing the persecution proposal, nature will draw her first for sure, and then $p_t - 1$ from the other $N - 2$ ordinary members by equal probability; if otherwise, nature will draw p_t from $N - 1$ ordinary members by equal probability. This assumption is not too unreasonable since the most senior ordinary member often poses the most significant threat to the king's power, creating a good reason for the king to purge her first (e.g., Francois, Rainer and Trebbi, 2015). This assumption discourages an ordinary council member from pulling out of an all-out contest for the kingship, because doing so would make her the unique most senior ordinary member at the following persecution stage and thus assuring persecution. This assumption is thus pro-conflict, which strengthens our results below on how robustly the judiciary can prevent contests.

Decision rules and strategies in focus. Since Proposition 2 has suggested that unanimity rule can prevent persecution and confer civil peace even without a judiciary, we narrow our attention to non-unanimity rules, i.e., $e \in \{2, 3, \ldots, N\}$. Since Proposition 1 has suggested that these rules can induce perpetual persecution and all-out contests without a judiciary, we focus here on whether and under what conditions there would exist MPEs that feature no persecution but perpetual peace.

4.2 Analysis and Results

We start with the scenario in which the elites are not connected so that the externality of persecution is absent, i.e., $\theta_t = 0$.

Lemma 3. *Starting from $\theta_t = 0$, the following strategy profile constitutes an MPE: in each period, each ordinary council member contests the kingship at the contest stage; at the persecution stage, the king proposes to persecute $e - 1 \geq 1$ ordinary members and makes no transfer to any judges; all judges vote for any persecution proposal.*

We prove Lemma 3 in Appendix G. The intuition is simple: since $\theta_t = 0$ is an absorbing state, no externality is involved in persecution; all judges are thus indifferent about persecution even without any transfers. Understanding this, the king can maximize his expropriation profit by proposing to persecute as many as possible, i.e., $e - 1$ ordinary members, and giving no transfer to any judges; for each ordinary member, withdrawing from an all-out contest would make her the primary target at the following persecution stage, so she always stays in the all-out contest instead.

Lemma 3 suggests that the risk of perpetual persecution and all-out contests in Proposition 1 would still be a concern even if a judiciary oversees persecution, as long as the elites are not connected with each other so that persecution does not involve any externality. Note that human society has often taken the risk of civil conflict and political violence seriously (e.g., Hobbes, 1996; Weber, 2004; Widerquist and McCall, 2017). Therefore, we now explore whether an MPE can feature persecution when the elites are connected with each other so that the externality of persecution is present, i.e., $\theta_t = 1$, but supposing that everyone understands that they will transit into the absorbing state of $\theta_{t+1} = 0$ after the current persecution stage and follow the MPE in Lemma 3 from then onwards.

Lemma 4. *Suppose that there has been a contest for the kingship in period t and all players understand that they will follow the MPE in Lemma 3 from period $t + 1$ onwards. The following claims about the persecution stage of period t are true:*

1. *in any MPE, any non-political judge i will vote for any persecution proposal if and only if the transfer proposed to her satisfies $T_{it} \geq cp_t \cdot R/(1 - \delta)$, and*

2. *any political judge i will do so if $T_{it} \geq cp_t \cdot R/\left(1 - \delta(1 - z)\right)$;*

3. *as $\delta \to 1$, in any MPE, the king will propose to persecute $p_t = e - 1$ council members if $\kappa > \left(\bar{N} - w - \bar{e} + 1\right)c$, and will propose to persecute none if $\kappa \leq \left(\bar{N} - w - \bar{e} + 1\right)c$.*

We prove Lemma 4 in Appendix H. The intuition is as follows. Since persecution incurs a negative externality to the judges and thus affects their welfare, each judge would need a compensatory transfer from the king to vote for any persecution proposal. Since the political judges will have opportunities to join the executive council and thus to contest the lucrative kingship in the state of social disconnectedness, which features perpetual all-out contests and persecution, it is cheaper for the king to influence them than the non-political judges, i.e., $cp_t \cdot R/\left(1 - \delta(1 - z)\right) < cp_t \cdot R/(1 - \delta)$. Therefore, the king can afford to get any persecution proposal approved if and only if the negative externality of persecution, i.e., c, and the number of non-political judges, $\bar{N} - w$, are sufficiently small, or the expropriation efficiency, i.e., κ, and thus the king's budget is sufficiently high, i.e., $\kappa > \left(\bar{N} - w - \bar{e} + 1\right)c$.

Lemma 4 suggests that once a significant contest has broken out, even having a judiciary and an elite circle where everyone is connected with each other will still be insufficient to prevent persecution, if there are too few non-political judges who are insulated from the opportunity to join the executive council in the future, i.e., there is a lack of *judicial insulation,* or if the elites' connection does not impose a strong potential negative externality of persecution, i.e., there is a lack of *social cohesion* among elites. This point leads to the main result of this section:

Proposition 5. *Suppose that everyone understands that once there has been a contest or persecution in the past, all players will follow the MPE in Lemma 3. As $\delta \to 1$, the following claims are true:*

1. *if $\kappa > \left(\bar{N} - w - \bar{e} + 1\right) c$, there exists a MPE that features an all-out contest and $e - 1$ persecutions in any period t with $\theta_t = 1$;*

2. *if $\kappa \leq \left(\bar{N} - w - \bar{e} + 1\right) c$,*

    (a) *there does not exist an MPE that would feature an all-out contest in any period t with $\theta_t = 1$;*

    (b) *there exists an MPE that features no persecution but perpetual peace in any period t with $\theta_t = 1$.*

We prove Proposition 5 in Appendix I. The intuition is as follows. For Claim 1, as the social discount factor is sufficiently high, i.e., $\delta \to 1$, when judicial insulation or social cohesion is low, i.e., $\kappa > \left(\bar{N} - w - \bar{e} + 1\right) c$, following Lemma 4, there is a MPE that features the king persecuting $e - 1$ ordinary council members for any subgame that starts from a persecution stage with connected elites, i.e., $\theta_t = 1$, and with a contest in the preceding contest stage. This persecution power will prevent each ordinary council member at the preceding contest stage from withdrawing from an all-out contest for the kingship, making it possible for the all-out contest to be Markov perfect. Taking this as given, we can fully construct a MPE that satisfies the claim after finding Markov perfect strategies for other subgames.

Conversely, when judicial insulation and social cohesion are both sufficiently high, i.e., $\kappa \leq \left(\bar{N} - w - \bar{e} + 1\right) c$, following Lemma 4, for any subgame that starts from a persecution stage with connected elites and with a contest in the preceding contest stage, the king will not be able to persecute anyone in the current persecution stage in any MPE. For Claim 2a, understanding this, each ordinary council member is thus comparing two options: the first is to participate in the all-out contest, have no persecution power in the following persecution stage if he wins the contest, and remain as the king facing another all-out contest in the next period as in Lemma 3; the second is to withdraw from the current all-out contest, enjoy a safe return of his asset for now, and then participate in the all-out contest in the next period as in Lemma 3. Since the probability to win the kingship in an all-out contest is too low, i.e., $\Pi^M(N) = \left(1 - \Pi^K(N)\right) / (N - 1)$, the ordinary council member will withdraw from the current all-out contest. Therefore, everyone always contesting whenever the elites are still connected cannot be Markov perfect.

For Claim 2b, understanding that the king at the persecution stage with connected elites and with a contest in the preceding contest stage will not have any persecution power, each ordinary council member at the preceding contest stage (potentially in perpetual peace without persecution) is thus comparing two options: the first is to stay in this situation and enjoy the safe return from her asset forever; the second is to challenge the king in a duel, enjoy no persecution power in the following persecution stage if she wins, and only hope to survive the all-out contest in the next period as the king as in Lemma 3. Since we have assumed that her disadvantage as an ordinary council member in a duel now would be significant while her advantage as a king in an all-out contest in the future would be insignificant, i.e., $\Pi^K(N)/\Pi^M(N) \leq \Pi^K(2)/\Pi^M(2)$, she will thus not challenge the king, making it possible for perpetual peace without persecution to be Markov perfect. We can thus eventually fully construct a MPE that satisfies Claim 2b after finding Markov perfect strategies for other subgames.

Table 2: Conflict or peace under non-unanimity rule with a judiciary

	Insulated judiciary	Uninsulated judiciary
Connected and socially cohesive elites	Perpetual all-out conflict not an MPE; perpetual peace an MPE	Perpetual all-out conflict an MPE
Disconnected or socially incohesive elites	Perpetual all-out conflict an MPE	Perpetual all-out conflict an MPE

Summary of Lemmas 3, 4, and Proposition 5.

Putting Lemmas 3, 4, and Proposition 5 together, Table 2 summarizes the results from this section: when taking the risk of civil conflict and political violence seriously, if the judiciary is not sufficiently insulated or if the elites are disconnected or not sufficiently socially cohesive, it is still always possible for society under non-unanimity rule to fall into an equilibrium of perpetual all-out civil conflict. It is only when the judiciary is sufficiently insulated and the elites are connected and socially cohesive, that society can break perpetual all-out conflict under non-unanimity rule as an equilibrium, maintaining perpetual peace without persecution. We discuss the implications of these results in Section 5.3.

5 Implications of Results

5.1 Perpetual Conflict, Civil Peace, and Decision Rules

Propositions 1 and 2 are our baseline results. They show the link from the decision rule e, a measure of political authority, to the possible occurrence of perpetual contests for such authority. We first discuss two implications that flow naturally from it.

Hobbesian wars: origins and solutions. Hobbes (1996) argues that human nature would lead to a war "of all against all," i.e., the Hobbesian war, and the only solution to it is a sovereign with unlimited authority. This is one of the founding ideas of modern political philosophy reflected in the Weberian view of statehood as the monopoly of legitimate violence (Weber, 2004, p. 33). In contrast, our Proposition 1 suggests that unlimited authority, i.e., $e = N$ in our model, can cause Hobbesian wars, and any *collective* veto power, i.e., $e \in \{2, 3, \ldots, N - 1\}$, is unable to preempt the risk of perpetual violence in a weakly institutionalized environment. Our Proposition 2 suggests that the only political regime that can confer civil peace in this context is unanimity rule with *individual* veto power, diametrically opposite to unlimited authority.

Why does political authority play such different roles in our model and in Hobbes's argument? First, note that in Hobbes's view of war, "men …use violence, to make themselves masters of other men's persons, wives, children, and cattle," i.e., "for gain" (Hobbes, 1996, p. 83). Here, "gain" is foremost the wealth grabbed when one defeats another, not the political authority that one can impose on others. In our model instead, the incentive to contest the kingship can only be the power it gives to persecute and expropriate. Political authority thus constitutes a fundamental motive for the Hobbesian wars in our model, and it is only when political authority is so constrained by unanimity rule that ordinary council members have no more incentive to contest, leading to civil peace.

Compared to Hobbes's argument, ours appears more consistent with anthropological evidence on violence. Systematically reviewing the evidence, Widerquist and McCall (2017, p. 163, 166) first observe that "[g]ain provides very little motive for attack" in the social-economic context of small-scale, stateless societies because "[t]he potential victim doesn't have much to steal," and "ethnographic and historical records reveal few if any instances in which [hunter-gatherer bands] fight over food, durable goods, or land," contradicting Hobbes's argument. Consistent with our model, the "much more relevant …causes of conflict …include, …most importantly, the common human desire to dominate others," i.e., authority over others (Widerquist and McCall, 2017, p. 166).

To avoid such conflict, as summarized by Widerquist and McCall (2017, p. 167), hunter-

gatherer bands thus "try not to let anyone dominate anyone else" and "take strong action to prevent any hierarchical structure from developing." Moreover, to prevent one-on-one bullying, "[a]lthough bands have no single individual authority figure to arbitrate disputes, anyone and everyone in the group might give their opinion," so that "[a]ll or most observed bands cultivate an ethos of nonviolence, humility, equality, freedom, and autonomy" (Widerquist and McCall, 2017, p. 167–168). As a result, "[v]iolence in stateless societies does not degenerate into a war of all-against-all or anything like it" (Widerquist and McCall, 2017, p. 138), in line with our Proposition 2. Also, given the extremely limited durability of goods in small-scale, stateless societies, peace is achieved without many enforceable "contractual promises" (Widerquist and McCall, 2017, p. 163). This is consistent with our notion of weakly institutionalized environments and our focus on Markov strategies.

When political authority is present, on the contrary, Widerquist and McCall (2017, p. 138) conclude that "[e]arly states and empires are perhaps the most violent and warlike contexts in which humans have ever lived," consistent with our Proposition 1. In particular, Hobbes's solution, i.e., "the absolutist monarchical system," even with "a built-in strategy to break the link between the dominance motive and conflict by prescribing succession through fixed rules, …has had limited success as thousands of years of wars of succession attest" (Widerquist and McCall, 2017, p. 166).

Justification of individual rights. As we primarily interpret the decision rule e as the political regime, we can also interpret it as the level at which some fundamental rights, such as the right to be free from arbitrary persecution and expropriation, are secured. Unanimity rule ($e = 1$) secures the rights at the individual level, collective veto power ($e \in \{2, \ldots, N-1\}$) does so at a group level, and dictatorship ($e = N$) does not secure any rights at the individual or group level. In this sense, domains of inalienable human rights, which cannot be altered by majority vote, can be understood as domains over which unanimity rule applies.

Under this interpretation, Proposition 2 implies that civil peace can be conferred in a weakly institutionalized environment when such rights are secured at the individual level, whereas Proposition 1 implies that any more limited veto power, say for any group of two or more, would run the risk of bringing perpetual conflicts. This is because security of such rights at any group level cannot prevent violation of each individual's rights, and the power to engage in such violation could lure everyone into conflict.

These implications offer a justification of individual rights. In the economics literature, property rights are often justified by their instrumental role in bringing more efficient economic outcomes (e.g., Grossman and Hart, 1986; Hart and Moore, 1990; Hart, 1995; North, 1987, 1990). This approach can be seen as part of the consequentialist, utilitarian, and

instrumental theories of rights, which justify individual rights by showing that "such an arrangement best promotes overall human welfare" (Quinn, 1993, p. 170). This approach contrasts with the deontological, status-based theories of rights, which justify individual rights by recognizing their intrinsic value (e.g., survey by Wenar, 2021). To our knowledge, we are the first to demonstrate that individual rights can be justified by their indispensability in preserving civil peace.

In addition, a third, contractual approach to justifying individual rights in the literature is to recognize them as "principles that would be chosen by properly situated and motivated agents agreeing to the basic terms of their relations," and "[t]he fact that these principles would be agreed to under the specified conditions is their justification" (Wenar, 2021). Following this approach, our Lemma 2 and Proposition 4 suggest that individual rights will be justified in a weakly institutionalized environment if unanimity rule is the status quo, or if the agenda-setting power in constitutional conventions lies in the council. Here, individual rights are justified because unanimity rule is agreed upon in constitutional conventions. The reason behind the agreement is that, following Proposition 2, unanimity rule confers civil peace under these institutional conditions.

5.2 Institutional Dynamics and Agenda-setting Power on Constitutional Issues

Our Propositions 3 and 4 provide implications on institutional dynamics and the agenda-setting power in constitutional conventions. Table 3 provides examples of stable political regimes, indicating regimes that are resilient to institutional shocks and have strong capacity of emergency management, in line with Corollaries 1 and 2. We discuss the implications in more details below.

Bimodality of political regimes in premodern times. As shown in Table 3, in weakly institutionalized environments, our model predicts that only the two extreme types of political regimes are stable: 1) unanimity rule, i.e., $e_t = 1$, in which the head of the council rules by unanimous consent; 2) dictatorship, i.e., $e_t = N$, in which the king has absolute authority and does not need consent from the council. Any regimes in between would collapse into one of these two regimes over time.

This implication is consistent with stylized facts about pre-modern political regimes. On the one hand, based on a comprehensive data set, Stasavage (2020a, p. 4–5, 29) observes that "[t]hroughout human history many societies on multiple continents have independently developed …early democracies, [whose] most crucial element …was [that the ruler] needed

Table 3: Stability, resilience, and emergency capacity of political regimes

Agenda-setting power on constitutional issues	Kingship	Council
Unanimous democracy, $e_t = 1$	↺ Early democracies, e.g., instructed representation with strict mandates, and most ancient city-states Consensual leadership of the Chinese Communist Party	↺ Venetian Republic American vetocracy
Collective veto regimes or non-unanimous democracies, $e_t \in \{2, 3, \ldots, N-1\}$	↓	↑
Dictatorship, $e_t = N$	↺ Most ancient bureaucratic, territorial states	

Expanded from Table 1, summary of implications of Propositions 3, 4, Corollaries 1, 2, and corresponding examples. When the kingship holds the agenda-setting power on constitutional issues, it is always the king who sets the agenda in constitutional conventions; when the council holds the agenda-setting power on constitutional issues, it is always an ordinary council member who sets the agenda in constitutional conventions. Self-pointing arrows indicate stability; examples of stable regimes are listed; straight arrows indicate directions of transition; the dotted frame indicates resilience to regime shocks and strong capacity of emergency management but without conferring of civil peace; the solid frame indicates regime resilience, strong emergency capacity, and conferring of civil peace.

to obtain consent for their decisions from a council or assembly …of individuals who are independent from [him] and who may well be [his] equals." Most importantly, such "consent …was not tacit [but] active," because "those who chose representatives could bind them with

mandates, and individual localities could either veto central decisions or opt out of them," thus creating "substantial blocking power and therefore a need for consensus" (Stasavage, 2020a, p. 6, 17). Such unanimous democracy with individual veto power corresponds to $e_t = 1$ in our model. Prominent examples of political regimes of this type included, but were not limited to, medieval and early-modern continental-European assemblies, which were under "instructed representation" with "strict mandates" (Weber, 1978, p. 293; Stasavage, 2020a, p. 17), and most ancient city-states, where "power ...tended to be shared ...among the heads of leading families and the wealthiest people, who were often the same individuals," and "[p]olicies were decided and issues resolved in councils" (Trigger, 2003, p. 103).

On the other hand, "autocracies ...were a clear alternative to early democracy," where "autocrats created bureaucracies staffed with subordinates they themselves had selected and they themselves controlled" (Stasavage, 2020a, p. 9). As Stasavage (2020a, p. 9) comments, "[t]his was fundamentally different from relying on a council or assembly composed of members of society not subject to the ruler's whim." Such autocratic rule without any need for consensus corresponds to $e_t = N$ in our model. Political regimes of this type were often present in territorial states, where "a ruler governed a larger region through a multi-levelled hierarchy of provincial and local administrators" (Trigger, 2003, p. 92).

There could have been a third, intermediate type of political regimes, i.e., non-unanimous democracies or collective veto regimes, corresponding to $e_t \in \{2, 3, \ldots, N-1\}$ in our model. Under these regimes, political participation would exist but be "episodic, ...[r]epresentatives [would not] be bound by mandates, [and] there [would be] a problem of 'tyranny of the majority' [to] grapple ...with" (Stasavage, 2020a, p. 17). Nevertheless, Stasavage (2020a, p. 17) notices that this intermediate type was rarely present among early democracies; Lord (1930, p. 138) observes that "in general it may be said that more or less imperative mandates were widely used in almost every parliament of the period, except in England and Aragon" (Lord, 1930, p. 138). As a result, "[a]utocracy was *the* alternative to early democracy" (Stasavage, 2020a, p. 9). Trigger (2003, p. 92) and Roland (2018, 2020) also observe this bimodality between ancient city-states and territorial states in terms of their political organizations, without real intermediate cases. The bimodality of political regimes in premodern times has thus been well observed.

The literature has also explored the origin and dynamics of institutions within the bimodality, for example, why certain civilizations adopted one instead of the other type of regimes, and how the bimodality in various institutional dimensions has persisted over time, while taking the bimodality itself as given (e.g., Finer, 1997a,b; Trigger, 2003; Greif and Tabellini, 2017; Mayshar, Moav and Neeman, 2017; Roland, 2018, 2020; Stasavage, 2020a; Jia, Roland and Xie, 2021; Greif, Mokyr and Tabellini, Forthcoming). Our Propositions 3

and 4 go further as they explain the bimodality itself.

In addition, on the persistence of the bimodality, Stasavage (2020a, p. 17) observes that societies that had the tradition of early, unanimous democracy would eventually evolve into the third, intermediate type, i.e., non-unanimous democracy, in modern times. We will discuss the socioeconomic and institutional conditions for the rise of non-unanimous democracy in Sections 5.3 and 6.

Lack of separation of powers and dominance of autocracy in premodern times.
Propositions 3 and 4 suggest that, to consolidate unanimity rule and civil peace, the executive power must be separated from the legislature when it comes to constitutional issues. Such separation is primarily a modern idea (e.g., Locke, 2003, p. 164–165; Weber, 1978, p. 283). In premodern times, on the contrary, the head of the executive was usually not separated from the legislature. For example, in ancient Greek city-states, "the [executive Council] *boulé* [of the Athenian Republic] had very tight control over the agenda of the [legislative] Assembly, [which] could discuss nothing that had not already been discussed in the Council and formulated by it as a *probouleuma* – a 'resolution'," whereas "[t]he 'presiding committees' [of the *boulé*] regulate[d] the proceedings and act[ed] in the name of the entire body," and the *boulé*'s "foreman (*epistates*) …was the president of the Athenian Republic [and] presided over the *boulé* and …the Assembly …also" (Finer, 1997a, p. 347). A similar lack of separation applied to the Roman Republic and most medieval European city-states, (e.g., Finer, 1997b, p. 402, 405, 436–437; Finer, 1997b, p. 967; Greif, 1995, p. 735). It was extremely rare that the legislature could exclude the head of the executive when initiating a discussion on the constitution, the Venetian Republic being a notable exception (Finer, 1997b, p. 990–1007). As a result, it would be almost impossible for the legislature to have agenda-setting power on constitutional issues.

Our Corollary 1 thus implies that early democracies should have been vulnerable to autocratic shocks, and that dictatorships, not democracies, should have dominated in premodern times. The vulnerability of early democracies to autocratic shocks was indeed evident in ancient Greek cities and medieval European city-states (e.g., Greif, 1994, 1995; Finer, 1997a,b; Zingales, 2017).[12] On the dominance of dictatorships in premodern times, Finer

---

[12]Within ancient Greek cities, "political forms" suffered "rapid turnover"; "in many places …power was …snatched forcibly …by some individual"; "monarchy" or "tyranny," characterized by "irregular seizure or exercise of power, personal rule, autocratic rule, [and] armed intimidation," i.e., "autocracy," eventually "reached its heyday in the sixth century BC" (Finer, 1997a, p. 331–333). Representative for medieval European city-states, Florence's "laws and institutions were chopped and changed with dizzying rapidity," and "nothing was more feared than the dominance of a single family," but politics was still finally consolidated by "the 'godfather' figures, like Maso degli Albizzi and those who succeeded him after 1382" (Finer, 1997b, p. 983–984); in Genoa, "several times during [the 11th–12th centuries] changes in exogenous conditions implied

(1997b, p. 950) observes that "[e]ver since the Roman Republic fell, the ideal and practice of government throughout the entire globe had been, without exception, monarchical"; although once "widespread in human societies" (Stasavage, 2020a, p. 61), early democracies "were exceptional, not the rule, and were short-lived at that" (Finer, 1997b, p. 951). Konrad and Skaperdas (2012, p. 417, 419) also observe "the prevalence of autocracy" versus the "problems of long-term viability" of the "consensually organized, self-governing state."[13]

Emergency capacity of unanimous democracy.   Political philosophers and real-world practitioners of power have viewed the ability of governments to be able to respond to emergency situations such as wars or natural catastrophes as a fundamental attribute of state capacity (e.g., Schmitt, 1985, 2014; Agamben, 2005; Sorell, 2013; Lincoln, 1953). Since unanimity rule can paralyze decision-making in emergencies while dictatorship can make decisions quickly, it is natural to dismiss unanimous democracy and even advocate dictatorship on these grounds (e.g., Schmitt, 1985, 2014).[14] Corollary 2 suggests that such dismissal is flawed: knowing that the council will be able to re-impose unanimity rule shortly after the emergency is dealt with, even if dictatorial power is needed right now, the council will not hesitate much to grant it, making unanimous democracy as effective as dictatorship in managing emergencies; if the king sets the constitutional agenda instead, although unanimous democracy is stable, the council will be reluctant to approve any request from the executive to expand its power to manage the emergency, knowing that democracy will not be able to recover once the executive power is even only slightly expanded.

This danger of losing democracy by temporarily granting emergency power to the executive has been well noticed since the collapse of the Roman Republic (e.g., Finer, 1997a, p. 432–438; Qin, 2021, p. 81–106). Note that this happened when there was an insufficient separation between the executive and the legislature, especially on constitutional issues. To start with, "[i]t was the [highest executive] *consuls* ...who convoked the [legislative] *comitia centuriata* and ...*comitia tributa*"; the Tribunes of the Plebs, a key component of the exec-

that a faction was ...strong enough to aspire to hold its influence in the consulate" so that "[t]he ability to expropriate ...the rent from Genoa's possessions ...motivated ...other Genoese ...to militarily challenge [the] political control," leading to "full-scale civil wars" and consolidating the shift of "Genoa's political system ...toward an autocracy" (Greif, 1994, p. 275–276; Greif, 1995, p. 736–737). On these, "a takeover of a democratic institution ('communes') by rich and powerful families who ran the city-states with their own commercial interests as a main objective [was] a common form of government in Italy from the 13th through the 16th centuries" (Zingales, 2017, p. 115).

[13]Konrad and Skaperdas (2012) explain the phenomenon by studying the trade-off between protection and production under competing provisions of protection. Not only providing an alternative explanation to the phenomenon, our result also explains why certain unanimous democracies, for example the Venetian Republic as discussed below, were indeed able to sustain in the long run.

[14]On this and other points, some scholars have seen a connection from Weber (1978, 2004) to Schmitt (1985, 2014). For references and discussions on the connection, see Engelbrekt (2009).

utive Magistracies, had the "unqualified ...right to convoke [and] the *ius agendi cum plebe* – the right to ...put resolutions to the [legislative] *concilium,*" which contributed to their extended tenures of authority; in 82–81 BC, Sulla instigated Valerius Flaccus to become the executive *interrex,* proposed himself to be "appointed ...'*dictator* for *making the laws* and *reconstitution* of the Republic,'" and had the proposal sponsored by Flaccus and approved "by vote of the [legislative] *comitia centuriata,*" effectively consolidating the agenda-setting power of the executive on constitutional issues (Finer, 1997a, p. 402, 405, 436–437; Bellen, 1975). It was from then to 27 BC that a "reign of terror [was] institute[d], ...the old constitution [was] abandoned" as Sulla and his successors set the constitutional agenda, and the Republic was eventually replaced by "the Empire," as "Octavian ...came to be addressed as *princeps,* that is, 'First Man in the State,' ...to express the nature of the new regime" (Finer, 1997a, p. 435, 582).

Following Corollary 2, when the legislature's agenda-setting power on constitutional issues is consolidated, unanimous democracy can allow temporary dictatorial executive power to deal with emergencies. As shown in Table 3, *only* unanimous democracy with the *necessary* help from a truly independent legislature can achieve *both* civil peace and strong emergency capacity. This insight is different from the political theories that approach these two highly-valued objectives by either advocating a supreme executive authority over the legislature to achieve them (e.g., Bodin, 1992; Hobbes, 1996; Schmitt, 1985, 2014), or emphasizing human rights relative to them to curtail such authority (e.g., survey by Philpott, 2020).

Florence vs. Venice. To further highlight the role of the agenda-setting power on constitutional issues in determining the capacity of unanimous democracy to deal with emergencies, we compare the institution of the Florentine Republic, as the representative of medieval Italian city-states, with that of the Venetian Republic, and their consequences, which we have listed in Table 3; Table 4 summarizes the comparison with more details.

Both Florence and Venice imposed strong checks and balances on their executive magistrates. According to Finer (1997b, p. 964, 979), "Florence exhibits all the characteristic features of the Italian city-republic, ...conform[ing] to the basic characteristic of the republics of antiquity, be they Greek or Roman." This system "includes ...the plural executive, bound by laws, as opposed to one-man rule," and "the executive is subject to multiplex power" (Finer, 1997b, p. 979). Eventually, "elaborate checks and balances in the system" were "to prevent any individual or his family ...obtaining absolute power" (Finer, 1997b, p. 968).

In this respect, Venice was similar. "[T]he [steering cabinet] *Collegio* could initiate legislation and decrees but could not enact them, while the [legislative] Senate could enact them

Table 4: Medieval Italian city-states: Florence vs. Venice

	Florence the representative	Venice an exception
Political regime	Elaborate checks and balances, i.e., unanimous democracy	
Legeslative agenda-setter	Chief executive body *Signoria*	*Savii grandi,* excluding head of executive *doge*
Procedure to grant emergency power	Cumbersome	Routine
Institutional resilience	Vulnerable to autocratic shocks	500-year republican constitution

Sources: Greif (1994, 1995), Finer (1997b), and Zingales (2017).

it but had no powers of initiative; [t]he [emergency] Council of Ten could not act without the [head of the *Collegio*] doge and his Inner Council, ...collectively known as the *Signoria;* [t]he doge could not act without his Inner Council, but for some purposes the latter could act in default of the doge" (Finer, 1997b, p. 995–996). As a result, "[t]he Venetian political system embodied ...checks and balances ...to an extremity that prevented any one organ," especially the doge and the Council of Ten, "from acting independently of at least one and usually more than one of the others" (Finer, 1997b, p. 995, 1005, 1007; also Greif, 1995, p. 735, 738).

Given the "elaborate checks and balances, the rotation of office, and the like" in both city-republics (Finer, 1997b, p. 1018), we read both the Florentine and Venetian political systems as requiring consensus from all relevant organs or powers for executive decisions, i.e., unanimous democracy in our model. Nevertheless, a crucial difference lies in who had the agenda-setting power on constitutional issues.

In Florence, "[t]he chief executive body, the *Signoria,*" which included the *gonfaloniere della giustizia* "with large armed force at his command," i.e., the head of the executive, "could initiate legislation on any matter whatsoever, ...and it saw its proposed laws through the legislative councils" (Finer, 1997b, p. 966–967). At the same time, these legislative councils "did not have legislative initiative: their task was to discuss and vote ...on the bills presented by the *Signoria*" (Finer, 1997b, p. 966–967). The agenda-setting power on constitutional issues was thus not separated from the head of the executive.

In Venice, although the *Collegio* initiated legislation, it was eventually the *savii grandi*

who "acted as the *Collegio*'s inner steering committees, ...formulated the agenda, ...and prepared all the business to be laid before it" (Finer, 1997b, p. 1003–1004). In practice, "[e]ach week one of the six *savii* took it in turn to discharge this task and for that period," notably, "he *(and not the doge)* acted as chief minister," so that "[t]he doge" merely "presided but it was the *savio* ...of the week ...who took the *Collegio* through the business and suggested what steps should be taken," i.e., either sending a proposal to the Senate or, in the case of emergency, the Council of Ten (Finer, 1997b, p. 1003–1004). The real agenda-setting power on constitutional issues was thus in the hands of these *savii grandi,* not of the doge, i.e., the head of the executive.

Given this difference in the agenda-setting power on constitutional issues, Corollary 2 implies that the Florentines would be worried about the substantial risk contained in expanding the executive power during an emergency; the Venetians, on the contrary, would be more ready to expand the executive power when needed, since their legislature would be more confident to re-impose checks and balances once the emergency were dealt with.

Indeed, when "immediate action was urgent," the Florentines "dealt with this extra-constitutionally: [t]hey would call [a] primeval general assembly, [i.e.,] the *Parliamentum,* ...set up ...an extraordinary commission, [i.e., the] *Balía,* ...and entrust it with emergency powers" (Finer, 1997b, p. 970, 996). As Finer (1997b, p. 970) describes, the procedure was extremely cumbersome, and even when these "*ad hoc* extraordinary institutions" were set up, "consultation could take time." At the same time, the risk of slipping into dictatorship was more than real: "[i]t is significant that in the last years of the fourteenth century and the first part of the fifteenth, when the Republic was taking its first unconscious steps towards personal rule, the *Parliamentum* and *Balía* were used more frequently, and to effect dramatic political changes" (Finer, 1997b, p. 970); "after 1382 ...[u]nder Maso degli Albizzi and his chosen successors, ...power moved away from the councils to private meetings, [and the] republic was moving to the *signoria velata* which the Medici would perfect after 1434" (Finer, 1997b, p. 979). Eventually, "[t]he constitution was suborned" (Finer, 1997b, p. 979).

In Venice, on the contrary, "[e]xtraordinary meetings could be called at the command of numerous magistracies which had been granted this right," and "when the *Collegio* wanted rapid and secret emergency action, it had the option of sending the business to the [Council of] Ten rather than the Senate" (Finer, 1997b, p. 996, 1006). Equipped with strong emergency capacity, as well as the resilience of its system, "[w]hen the other Italian city-republics were almost all extinguished and the kingdoms of Western Europe were on the highroad, it was Venice and not Florence that became emblematic of republicanism" (Finer, 1997b, p. 985). Since the executive's authority was limited by "overlapping authorities of various councils, ...the gains from capturing the Doge's post [was so] reduced" that Venice was

40

"characterized by internal tranquility," and "[t]here were hardly any violent internal political conflicts" (Greif, 1995, p. 735, 738). This lasted until 1797, when "she succumb[ed] to an invader, [having] successfully preserved her independence for over 1,300 years and the identical constitution for the last 500" (Finer, 1997b, p. 985). As Finer (1997b, p. 996) comments, 'the [Venetian] system successfully combined the principle of checks and balances "with that of emergency action." The comparison between the Venetian and Florentine Republics is thus consistent with our Propositions 3 and 4 and Corollaries 1 and 2.

American vetocracy vs. consensual leadership of the Chinese Communist Party.
To further illustrate the relevance of Propositions 3 and 4, we compare American "vetocracy" with the consensus requirement in decision-making within the Politburo Standing Committee of the Chinese Communist Party, which we have listed in Table 3; Table 5 summarizes the comparison.

Table 5: American vetocracy vs. consensual leadership of the Chinese Communist Party

	American vetocracy	CCP leadership
Political regime	"Excessive" checks and balances/consensus requirement, i.e., unanimity rule	
Legeslative agenda-setter	Congress, not President	General Secretary, i.e., head of executive
Emergency power	Quick to grant, confident of renewing constraints later	Once granted difficult to withdraw

Sources: Shirk (1993, 2018), Huang (2000), Tsebelis (2003), Agamben (2005), Vogel (2005), Fukuyama (2014), CPC (2017), Xie and Xie (2017), Chafetz and Pozen (2018), Fewsmith (2018), NPC of China (2018), CCCPC (2021), and Li, Roland and Xie (Forthcoming a).

Both regimes can be interpreted as functioning by unanimity rule. As Fukuyama (2014, p. 488) comments, the American political system is "a complex system of checks and balances that was deliberately designed …to constrain the power of the state." Following Tsebelis (2003), Fukuyama (2014, p. 493, 499) reads these "excessive …checks and balances" as "too many …veto players," labeling the American system a "vetocracy." In Chinese communist politics, a united image of the Party has always been fundamental for the single-party authority; the disastrous outcomes of Mao's last years are still fresh in memories (e.g., Xie and Xie, 2017; Shirk, 2018; Li, Roland and Xie, Forthcoming a). Since the late 1970s until Xi's ascent to power in 2012, important decisions required consensus within the highest leader-

ship of the Party so that even the weakest Politburo Standing Committee member could constrain the General Secretary (e.g., Shirk, 1993, 2018; Huang, 2000; Vogel, 2005; Xie and Xie, 2017; Li, Roland and Xie, Forthcoming a).

One big difference between these two examples is who has legislative agenda-setting power. In the United States, this power is vested with Congress, which, notably, excludes the President, and "in American political culture, …Congress jealously guards its right to legislate" from the Presidents' effort to shape legislations (Fukuyama, 2014, p. 496). Our Corollary 1 suggests that this separation of powers and the legislative agenda-setting power allows American vetocracy to be resilient when faced with regime shocks. Consistent with Corollary 2, the need for temporary expansion of presidential powers to deal with emergencies, for example, during wars, has usually been followed by renewed constraints on the executive, once the emergency has been dealt with, and is thus less threatening to the veto regime. A prominent example can be found in Congress's passing of Amendment XXII to the United States Constitution after the presidency of Franklin D. Roosevelt (e.g., Chafetz and Pozen, 2018).

As a result, although being criticized for "sometimes making it impossible altogether" to reach collective action on normal policy issues, Congress can still "delegate huge powers to the executive branch, allowing it to operate rapidly and sometimes with a very low degree of accountability," especially during economic and security crises (e.g., Agamben, 2005; Fukuyama, 2014, p. 493, 497–498). At the same time, Proposition 2 suggests that the American vetocracy is necessary for civil peace, especially given the political polarization within American society (e.g., Fukuyama, 2014, p. 489–490). In this sense, Congress as the legislative agenda-setter helps affirm simultaneously strong emergency capacity, checks and balances on the executive, and civil peace within the American vetocracy.

The picture is different when it comes to the highest leadership of the Chinese Communist Party. The agenda-setting power on all issues, including the constitutional issues of the Party and the state, rests in the hands of the General Secretary: Article 23 of the Party's Constitution specifies that "the General Secretary …is responsible for convening meetings of the Political Bureau and its Standing Committee," i.e., the highest governing bodies of the Party and the state, "and shall preside over the work of the Secretariat," i.e., the operational agency of the Party's leadership (CPC, 2017). It is thus impossible for the Party and its leadership to separate the agenda-setting power on the Party's constitutional issues from the General Secretary.

Our Corollary 1 thus suggests that the consensus requirement within the Party leadership should be vulnerable to shocks of personalistic rule. This is consistent with the reading by Shirk (2018) and Li, Roland and Xie (Forthcoming a) about the recent anti-corrupting cam-

paign: problems of corruption, inaction, and political rifts within the Party mounted under Xi's predecessor; as a result, when Xi became the General Secretary in 2012, he had a rare window to consolidate his power via the urgently needed anti-corruption campaign.[15] After the main push of the anti-corruption campaign, however, there was no return to consensual leadership, and Xi's rule became increasingly personalistic (e.g., Shirk, 2018). The Party has even led the legislative National People's Congress to approve the 2018 Amendment to the Constitution of China, abolishing the term limit for the Presidency of the state (NPC of China, 2018). All recent developments suggest that Xi is likely to break the post-1989 norm that one should not serve as the paramount leader for more than ten years (Fewsmith, 2018; CCCPC, 2021).

5.3 Social Cohesion among Elites, Judicial Insulation, and Preservation of Peace under Non-unanimity Rule

Our Lemmas 3, 4, and Proposition 5 imply that only when the judiciary that oversees persecution is sufficiently insulated from the executive *and* embedded in an elite circle in which everyone is connected with each other and socially cohesive, can society be free from political persecution and civil conflicts under a non-unanimity rule. This implication is consistent with the English experience in its transition from perpetual civil wars to peace at the turn of the 17th to the 18th century.

The English experience. As Stasavage (2020a, p. 17, 206–207) observes, "[c]ouncil and assembly governance existed throughout Europe during the medieval and early modern periods, ...where deputies were often bound by strict mandates, and local constituencies had the latitude to refuse central decisions." Since these mandates implied a veto power of each local constituency and greatly constrained the power of the ruler, since the 13th century, European monarchs had tried to summon the deputies with *plena potestas,* i.e., "full powers" without a mandate (Post, 1943, p. 368–370), but "their attempt ...met with limited success [and] often failed to work" (Stasavage, 2020a, p. 17, 130, 223–224). It was only in England where "*plena potestas* really took off" – "[a]s early as the fourteenth century, ...English monarchs ...succeeded in imposing the requirement that deputies be sent without mandates from their constituencies, ...[n]or could their constituents require them to refer back for approval before final decisions were made, and ...majority decisions [were] binding ...with no possibility for individual localities to block decisions or opt out of them"

---

[15]For more studies on conceptual understanding of the anti-corruption campaign, see, for example, Lu and Lorentzen (2018), Xi, Yao and Zhang (2018), and Li, Roland and Xie (Forthcoming a).

(Stasavage, 2020a, p. 17–18, 130–131, 197, 212, 223–224). Weber (1978, p. 293–296) has also made a similar observation, where he calls the mandate system prevailing in medieval Europe "instructed representation" and the English exception "free representation." We thus read the political regime of early-modern England as a non-unanimous, majority rule in our model.

The House of Lords was supposed to be the judiciary that oversaw persecution of peers using majority rule (Lovell, 1949, p. 75). Against the backdrop of "local economic isolation" in the late 14th and 15th centuries, the aristocracy was "far from united" and "seriously divided" by "bitter …private feuds" and "local rivalries," which were easy to be "multiplied" and "escalat[ed]" (Plumb, 1967, p. 4; Wilkinson, 1969, p. 310–318). Our analysis in Section 4 predicts that a judiciary embedded in such a disconnected or socially incohesive elite circle would not be able to provide sufficient protection for elites against persecution. Indeed, in the late 14th century, the "abuses of cases …had become so palpable …in the House of Lords" (Lovell, 1949, p. 70–71); in the 15th century, "the king *de facto* periodically proscribed his enemies …by act of parliament, [i.e.,] the act of attainder, …without, or so it seems, any …judicial process" (Bellamy, 1970, p. 177).

Although the House of Lords could not provide sufficient protection against persecution, the lords in the late Middle Ages still often "found the crown unwilling to admit …their claims [of] jurisdiction …over peer trials …[e]ven with the reduction to …*in rem*" (Lovell, 1949, p. 70–71). Their claims were eventually recognized by Henry VII, but "without the spirit of those claims" (Lovell, 1949, p. 71). In 1499, "Henry VII …took the old Court of Chivalry, made all its members peers, and replaced the constable at its head with a previously existing palace official, the lord high steward." Since then, this "prerogative creation" of the crown, the Court of the Lord High Steward, "tried peers …when Parliament was not in session, a condition not onerous for the Tudors, whose reigns saw all peer trials (ten treason cases) in this court" (Lovell, 1949, p. 75). Given that "the prior selection of triers by the crown" always put the triers under the crown's patronage with potential appointments to senior executive or ministerial positions in the future, we can read almost all the triers as the political judges in our model. Lemma 4 and Proposition 5 thus predict that such an uninsulated judiciary would not be able to constrain the kingship's persecution power. Although the Stuarts "decreased [the] use of this court" in the 17th century, the Court "ensured the crown control of peer trials" as "the general result": from 1499 to 1686, among the 16 peer trials in the Court, there were "only three acquittal verdicts"; among the 20 in total during the same period, only four in total were acquitted; all the cases on trial were capital cases (Lovell, 1949, p. 75, 79).

Given the lack of economic and social cohesion among the elites, the frequent failure of

the judiciary to assert its jurisdiction over peer trials, and also the lack of judicial insulation, our model predicts that England must have faced a significant risk of civil conflict under the its non-unanimity rule during the 14th–17th centuries. Indeed, England "had scarcely been free from turbulence for more than a decade at a time" during this period (Plumb, 1967, p. 1), and "experienced a civil war roughly every fifty years, …continu[ing] up until the great Civil War of the 1640s" (Fukuyama, 2018, p. 15). These wars were "often extremely bloody, …occasionally involved tens of thousands of combatants on both sides, and led to the deaths of equal numbers of people" (Fukuyama, 2018, p. 15, 17). Moreover, these wars "pitted a monarch …against various elite opponents" for "political power and, ultimately, dominance" (Fukuyama, 2018, p. 17, 20).

It was only in the mid-17th century that the preconditions for perpetual civil conflict started to wane. On the socio-economic front, a Durkheimian rise of connection, interdependence, and social cohesion among the elites was underway. As Plumb (1967, p. 4) summarizes, "[t]he development of inland navigation, …together with the great drains recently cut to reclaim the Fens, …had brought some of the most fertile and productive [and] rapidly developing …regions of England within easy and cheap reach of London and the great outports." This development "led to …the steady growth of the home market, …a greater diversification of economic enterprise, …and the gradual obliteration of local economic isolation" among the elites (Plumb, 1967, p. 3–5). Besides these, "a dramatic growth in trade to America and the Indies …required ever-greater conglomerations of capital and more sophisticated financial methods, which involved both the Crown and those very rich men on whom all monarchs had to rely" (Plumb, 1967, p. 3). The increasingly "complex" and "involved" financial structure further strengthened the connection, interdependence, and social cohesion among the elites (Plumb, 1967, p. 3).

On the institutional front, several critical developments helped England achieve judicial insulation at the turn of the 17th century. First, under the "supremacy of Parliament" after the Glorious Revolution of 1688, "[t]he Treason Act of 1695 provided that so long as a majority [in the House of Lords] was sufficient for treason conviction of peers, in such treason cases all peers must be summoned as triers, thereby destroying the usefulness of the court [of the Lord High Steward] to the crown, which never thereafter constituted it even for simple felony trials" (Lovell, 1949, p. 76). Second, the number of eligible memberships of the House of Lords sharply increased during the 17th century from under 60 to nearly 200 (Russell, 2013, p. 17), admitting many more lords who were politically inactive, often skipping regular sessions, but "attached …importance" only "to the state trials" with "high attendance figures" (Rees, 1987, p. 195, 240, 245–246).[16] Third, although minor offenses or

---

[16]In the 18th century, "[e]ach session" of the House of Lords, "a solid core of about one-third of the

civil cases involving a peer had been processed not in the House of Lords but in a common law or prerogative court, from the Triennial Act 1641 that "abolish[ed] all the prerogative courts," to the Act of Settlement 1701 that "lay down unambiguously that [all court] 'Judges' Commissions be made *quamdiu se bene gesserint* (for as long as they act well),'" the whole judicial system became "entirely free-standing, bound only by statute, [and] decoupled from the main apparatus of central government" (Finer, 1997c, p. 1347). In the language of our model, all these developments increased the number of non-political judges in our model and, therefore, helped achieve judicial insulation.

Given the sufficient connection and social cohesion among elites and total insulation of the judiciary from the executive, Lemma 4 and Proposition 5 predict that the judiciary could have become capable of constraining the persecution power of the kingship and, therefore, preventing England under the majority rule from falling into perpetual civil conflict. Consistent with the prediction, since the late 17th–mid-18th centuries, the "engine of the crown" to control peer trials and political persecution has been "wrecked," and persecution of peers has become extremely rare (Lovell, 1949, p. 76, 79); from the 18th century on, England has been "completely ...peaceful and internally stable" (Fukuyama, 2018, p. 15).

Other premodern or early modern European states.   Besides early modern England, how were the levels of judicial insulation and elite cohesion in other premodern or early modern European states?

Table 6 provides a classification of these states based on our theory. In the top-left quadrant is early modern England, the case just discussed. What about the other quadrants?

Polish–Lithuanian Commonwealth and typical medieval Italian city-republics. In the bottom-left quadrant are states that had a quite insulated judiciary but disconnected elites. For example, in the Polish–Lithuanian Commonwealth, the judicial power "[a]t the highest level" was held by the "the principal legislative body," i.e., the *Sejm,* which "reserved its right to act as the supreme court [and] tried important cases of treason" and other state trials "in the name of the Republic" (Davies, 2005, p. 267).[17]

On the one hand, the *Sejm'*s membership was entitled not only to the "mighty magnates,"

---

membership never went up to London and, moreover, made no arrangements to be represented by proxy," and "[p]olitical leaders ...were annually confronted with [the] problem ...to secure ...their supporters' ...attendance in the House of Lord," whereas "state trials [had] high attendance figures" due to "social attraction and curiosity" (Rees, 1987, p. 240, 245–246). Rees (1987, p. 195–197, 246–249) discusses the observation with more data.

[17]Since the 15th century, the king did not "have the power to confiscate noble estates without previously securing a judgement in a court of law" and "the famous principle of *neminem captivabimus nisi iure victum,*" i.e., "nobody could be imprisoned until convicted of a crime in a court of law" (Frost, 2015, p. 140, 305).

Table 6: Judicial insulation, elite cohesion, and political regimes of premodern or early modern European states

	Insulated judiciary	Uninsulated judiciary
Connected and socially cohesive elites	Majority rule Early modern England	Unanimity rule Venetian Republic, Athenian democracy
Disconnected or socially incohesive elites	Unanimity rule Polish–Lithuanian Commonwealth, most medieval Italian city-republics	Unanimity rule French *Ancien Régime,* Crown of Castile, Dutch Republic

Examples consistent with implications of Lemmas 3, 4, and Propositions 1, 2, and 5.

but also to "every one of the …noblemen …[i]n principle" (Finer, 1997b, p. 1047). Such a "wide …ruling stratum" counted for "8 to 12 per cent [of] the population," even "much higher than in England," and included "many [lower noblemen] as poor as some of their peasants," who were never politically "ambitious" to join the crown's executive (Finer, 1997b, p. 1047; Frost, 2015, p. 352–353). In the language of our model, the Polish–Lithuanian judiciary was thus highly insulated from the executive.

On the other hand, given that Poland was "a land of vast distances, sparse communications, and comparatively feeble urbanization" in the late Middle Ages, the Polish noble estate, i.e., the *szlachta*, had always featured "an intense particularism" that were closely attached to "tribal divisions, …regional loyalties, [and] local magnates" (Finer, 1997b, p. 1045). In addition, the bitterness between the Polish and Lithuanian elites was not appeased and "soured considerably" by the Union of Lublin (Frost, 2015, p. 494). It is thus reasonable to conclude that the elites in the Commonwealth were socially incohesive in the sense of our model.

A similar characterization can be made for most medieval Italian city-republics. "[A] uniquely medieval Italian innovation," one of the "common characteristics [of] [t]he …city-republics of the fourteenth century," except for Venice, was "the *podestà* in charge of judicial business," which had been "grafted on to [the legislative and executive] councils" since the

13th century (Finer, 1997b, p. 963–964, 980). "[A]ssigned bodies of armed men [and] considerable staffs, [the] *podestà* and judges" had an "independent status," to which "the executive [was] subject" (Finer, 1997b, p. 967, 979).

One key feature of the *podestarial* judiciary was that "all the ...cities [other than Venice] perforce drew their *podestà* and their judges from other places, [not] call[ing] on its own native population" (Finer, 1997b, p. 1008). These foreign judicial officials were not eligible to join the executive bodies of the city in the future, so they were perfectly insulated from the executive in the language of our model (Finer, 1997b, p. 963, 966, 968–970; Waley and Dean, 2010, p. 40).

In addition to being foreign, the *podestà* should "have no relatives [or] have had offices" recently in the city; the appointment was very short, typically "only ...six months or a year"; "when in office," he was not "to eat or drink in the company of any citizen [and] could not engage in trade"; "at the end of his term, ...he [was to] undergo ...the routine investigation of his tenure [and] not immediately re-eligible for appointment ...in the same city" (Waley and Dean, 2010, p. 41–42). Given all these restrictions, it is safe to say that the *podestarial* judiciary of a typical Italian city-republic was not connected with the native elites.

Venetian Republic and Athenian democracy.   In the top-right quadrant of Table 6 are states that had inter-connected and socially cohesive elites but a judiciary that was not insulated from the executive. For example, in the Venetian Republic, the judicial power was held by "the [Council of] *Quarantia* (Forty)," which was "chief[ly] ...the Court of Appeal" in the late 12th century and "[l]ater ...became a judicial bench exclusively" (Finer, 1997b, p. 989–990).

Notably, "[t]he high magistracies" of the Republic, including members of the judicial Forty and executive councils, "were drawn ...from [an] inner circle ...consisted of not more than about 150 men" (Finer, 1997b, p. 1004, 1009). These "great families intermarried," creating an "undoubtedly mitigating effect" on the inter-clan relationship, and "one clan might assist another on a particular occasion and then be repaid in kind by that other clan many years later," building "'honest' graft ...[b]y way of this association" (Finer, 1997b, p. 1010–1011). In addition, "Venice was [such] a gerontocracy" that "[t]he *vecchi*, [i.e., the old,] shared the experiences of a lifetime of wheeling and dealing and negotiating with one another" (Finer, 1997b, p. 1011–1012). As a result, Venice had closely connected and social cohesive elites, who "did not act as murderously rival factions" (Finer, 1997b, p. 1011).

At the same time, these elites "constantly revolved from one elected post to another" (Finer, 1997b, p. 1004). In particular, "this rapid rotation [could be] from ...the [judicial] Forty [after a] two-monthly term ...to ...a ducal councillor," who sat with the doge in the

highest-executive *Collegio* (Finer, 1997b, p. 994, 1004). In the language of our model, the judiciary of the Venetian Republic was thus not much insulated from its executive.

A similar case can be made for the Athenian democracy. In Athens, the judiciary was primarily the legislative Assembly: it "had jurisdiction over offences allegedly against the state," especially through a procedure of "the *eisangelia,*" i.e., "impeachment," during which "the Assembly ...acted like an American Grand Jury and voted on whether there was a prima facie case," before trials "in a popular court ...or by the Assembly itself" (Finer, 1997a, p. 345–346). In the case of conviction, the court and Assembly "could impose any penalty," including "ostracism, [i.e.,] dishonourable banishment with confiscation of goods, a range of forfeitures and fines, and, for the most serious crimes, the death penalty" (Finer, 1997a, p. 346, 356–357).

Although "[t]he distinction between the deliberative, the executive, and judicial 'powers' is ...recognized explicitly by Aristotle," the citizens who exercised these powers were closely connected and socially cohesive (Finer, 1997a, p. 355). Traditionally they had resided within the "tiny" territory of "Attica, with Athens as its capital," which was "just the same size as Hong Kong" (Finer, 1997a, p. 341). "[L]eaders of the democratic [and] the opposing oligarchic part[ies]" had already come from the same "ancient and wealthy lineages" (Finer, 1997a, p. 342–343). "Up to the end of the sixth century BC, ...[a]ll this ...trib[alism]," if any, was eventually "changed by Cleisthenes": "the citizenry [was] 'mixed up' [and] sectionaliz[ed] [into] ten *phylae* (misleadingly translated as 'tribes')," each of which "[c]riss-cross[ed] ...the City, the Coast, and the Plain ...and their [traditional] settlements" and "would contain men from the three [areas] alike" (Finer, 1997a, p. 344). "Henceforth the *locus* for determining citizenship," which was the key to the Athenian political life, "was no longer the *phratry,*" i.e., the clan (Finer, 1997a, p. 344).

One may also note that in Athens any substantial insulation between the judicial and executive powers would be against "[t]he guiding principle of the political system, [i.e.,] the *demokratia,*" which specified that, "with the rarest exceptions, all posts, whether executive, legislative, or judicial, should be open, by rotation, to the entire citizen body for a one-year term" (Finer, 1997a, p. 345). In particular, "[t]he Council, [which] was the essential organ of executive power, ...the magistracies, [who] were the executive agents of the Council and Assembly, [and] the judiciary" were all "filled by casting lots (sortition) ...annually" from the same pool for the Assembly, i.e., "all citizens, ...with minor qualification" (Finer, 1997a, p. 345, 347–348). Moreover, the executive "Council had certain judicial functions, too": it could initiate "the *eisangelia*" and "challenge claims to citizenship," potentially leading to ostracism (Finer, 1997a, p. 348). Therefore, not only could the elites who had judicial power join the executive in the future, but some already had the executive power. We can thus

conclude that judicial insulation was low in the Athenian democracy.

French *Ancien Régime,* Crown of Castile, and Dutch Republic.   In the bottom-right quadrant of Table 6 are states that had neither an insulated judiciary nor connected elites. The very first example is the French *Ancien Régime.* This regime is of special interest because its social background was "typical of the European political situation," its institutional arrangement was "the ...preeminent ...model in Europe," and the political development of "[m]ost European states of the late medieval and early modern periods conformed, more or less closely, to the French pattern" (Strayer, 1970, p. 49).

Under the French *Ancien Régime,* "[f]eudal custom provided that a peer could be tried in the *curia regis* by the other peers when his life or his fief were in question" (Cuttler, 1981, p. 94). Note that in this tradition, the *curia regis,* literally the "royal council," could be read as the executive council that we have modeled. Legally, although "the *Parlement* [of Paris] was the highest court in the kingdom" and "had a general civil and criminal jurisdiction," still, "a king could ...override" the *Parlement* by "send[ing] it *lettres de jussion,* [i.e.,] orders for immediate registration [of] the edicts of the king, ...hold a *lit de justice,* [i.e., 'a sitting of justice,' or even] exile recalcitrant members ...and ...abolish the [*Parlement*] altogether" (Cuttler, 1981, p. 115; Finer, 1997c, p. 1310–1311). In practice, "the custom by which the peers themselves pronounced sentence ...was a privilege and not a right [and] fell into desuetude during the fourteenth century" (Cuttler, 1981, p. 94). From then to the 18th century applied the principle that "*adveniente principe, cessat magistratus,*" literally "arrives the king, ceases the court": in the *Parlement* "it was the king who pronounced judgement ...with the attendance of ...royal councillors selected by the king," while "the peers had only an advisory, if not simply a decorative, rôle" (Villers, 1984, p. 264; Cuttler, 1981, p. 114).[18] In addition, "for a long time ...the members [of] the *Parlement* [and the] 'King's Council' ...remained interchangeable" (Langlois, 1922, p. 72). Therefore, traditionally, legally, practically, and personnel-wise, in the language of our model, the judicial power of the French *Ancien Régime* was not only uninsulated from the executive but also ultimately held by senior members, or simply the head, of the executive.

To understand the relationship among the players who held judicial or executive power under the *Ancien Régime,* note that both the *Parlement* and the King's Council "had taken shape ...at the expense of the former *Curia Regis,*" and "traces of their original unity [from the *Curia*] persisted" (Langlois, 1922, p. 71–72). Within this tradition the "[g]reat seigneurs and prelates," who "frequently adopted the practice of attending the *curia regis* by proxy,"

---

[18]Weber (1978, p. 230) also notes "the principle of Germanic law ...that in [the king's] presence the jurisdiction of any court is suspended."

often tended to "indefinitely …remain …in the seclusion of their estate" (Ulph, 1951, p. 226). Over time, as new territories were acquired through annexations, these regional powers and noble houses clearly had their "own …custom [with] a wide degree of diversity in local practices," making "France …a mosaic state, made up of many pieces …with widely divergent characteristics" and strong "particularism and sense of local identity," especially "in many of the out-lying provinces" (Strayer, 1970, p. 50, 52–53; Myers, 1975, p. 71). This encouraged the development of "widely differing institutions" that were "peculiar" while "deep-rooted" and "entrenched" in many regions under the respective noble houses, "especially [the ones that] had had a tradition of semi-independence of the Crown, such as Normandy, Languedoc, Dauphiné, Burgundy, Provence, and Brittany" (Strayer, 1970, p. 48, 51; Myers, 1975, p. 71). As a result, French national politics had "conflicting" and "narrow local views and interests" to "reconcile" (Lord, 1930, p. 138; Strayer, 1970, p. 52). In the extreme, regional and family rivalries could lead to assassinations or even civil wars, as in the case of the Armagnac–Burgundian feud (Langlois, 1922, p. 126–127). We thus read the French *Ancien Régime* as having a low level of interconnectedness and social cohesion among the elites who had the judicial and executive powers.

A similar case was the Crown of Castile. Since Alfonso X, "the royal tribunal [was] the judicial arm" of the Crown and "claimed exclusive jurisdiction …over …treason to the king" and other high crimes committed by nobles (O'Callaghan, 1993, p. 42–44). Although the nobility "repeated the request" for "trial by their peers" and later kings "promised to include noble justices," the king-appointed justices in the tribunal "were expected to be men who feared …the king" and were not the peers, sometimes "all laymen" (O'Callaghan, 1989, p. 159–160; O'Callaghan, 1993, p. 43). Legally, in Castile "appeals would be carried from the ordinary royal judges to the *adelantado mayor* of Castile," who was "a territorial administrator," hence "ultimately to the king," and the king "s[at] in judgement" on a regular schedule (O'Callaghan, 1989, p. 159–160; O'Callaghan, 1993, p. 43). The Castilian judicial power was thus uninsulated from and eventually held by the executive in the same way as their French counterpart. At the same time, the nobility held "suspicion of the judges as professionals" (O'Callaghan, 1989, p. 160), while the general "enmity between the Castilians and Leonese" pervaded. All this made the former statement of "narrow local views and interests" about France also apply here (Lord, 1930, p. 138). We thus categorize the Crown of Castile as having insufficient social connectedness and cohesion among the elites in our model.

The final example in this quadrant is the case of the Dutch Republic. In the decentralized state, "there was no central court of justice for the Republic as a whole" (Price, 1994, p. 215). Instead, as seen in the "most spectacular example [of] the arrest and trial of [Johan

van] Oldenbarnevelt and his associates in 1618–19," state trials were held in "a special, …*ad hoc* court set up by the States General" (Price, 1994, p. 214–215). "The States General consisted of the delegations from [the] provinces" to decide over "certain important matters" for the Republic (Price, 1994, p. 211–215). In particular, during state trials and "for [this] specific purpose, the States General was able to exercise powers that were unambiguously sovereign" (Price, 1994, p. 215). In this sense, we can read the judiciary as part of the executive, rather than insulated from it.

It is important to note that the United provinces, which sent delegates to the States General, were "not so united" but had a "rather limited sense of common identity" (Price, 1994, p. 221). Indeed, "their traditions were of mutual conflict rather than of co-operation," and "sharp differences [in] economic and social development and structure" generated "deep jealousies, even perhaps hostility" among them (Price, 1994, p. 221, 223). These "had inevitable and important effects on the politics of the Union, [especially] in foreign policy," given "their different interests and …values" (Price, 1994, p. 225, 233). Therefore, "there was a real question about the viability" of the Republic, and "many [even] feared that once the war [against Spain] was ended, the alliance would also collapse and with it the Union" (Price, 1994, p. 221, 234). "[W]here language and culture were concerned," the differences did not help either, especially when complicated by the religious "conflict between remonstrants and contraremonstrants," as they saw each other "as a threat to the survival of the state" (Price, 1994, p. 223; Price, 1998, p. 101, 103). Given all this, we read these delegates to the States General, who held the executive and judicial powers of the Dutch Republic, as socially incohesive.

Judicial history and political regimes in continental Europe. Lemmas 3 and 4 and Proposition 5 imply that societies that have disconnected or socially incohesive elites or an uninsulated judiciary are prone to judicial abuse and political persecution and run the risk of civil conflict. Proposition 2 then implies that such societies, under such a consideration, could adopt unanimity rule, i.e., a political regime that would grant elaborate checks and balances and overlapping of powers so that each individual stakeholder has veto power in any state decisions. The judicial history and political regimes of the examples discussed above were indeed consistent with these implications. We now briefly discuss them one by one.

In the Polish–Lithuanian case, even under the famous 1505 principle of "*Nihil Novi,*" i.e., "nothing new …should be decreed …without the common agreement" from the *Sejm,* which recognized the nobility's collective, not individual, veto power, the bigger players still had "their carefully concocted plans" to override lesser members in the *Sejm* (Finer, 1997b, p. 1049; Frost, 2015, p. 349). As a result, in 1652, "[m]ajority voting was consciously rejected"

because of "the prospect of chaos" (Davies, 2005, p. 259). Instead, "to check the absolutist designs of the Polish monarchy," the famous, "politicide"-like *liberum veto* was adopted, granting individual veto power to each single member of the *Sejm* (Finer, 1997b, p. 1049; Davies, 2005, p. 266).

For most medieval Italian city-republics, the *podestarial* judiciary worked to "promote political order" only when a "delicate balance of power [was] maintained" by a carefully designed political regime with "elaborate checks and balances" (Finer, 1997b, p. 1018; Greif, 2006, p. 241). Under autocratic shocks when the unanimity rule was temporally broken by an individual or family capturing multiple important organs or powers, especially when required by emergency management, the *podestarial* judiciary was not able to maintain the political order (Greif, 2006, p. 245–246). This was also consistent with the institutional features that the *podestà* was "appointed by and responsible to the [executive] *Signoria*" and required "a sufficiently high wage," which would made him easy to be captured by the executive during a general emergency when the executive had extensive authority while the republic was under pressure (Finer, 1997b, p. 967; Greif, 2005, p. 751; Greif, 2006, p. 240). As discussed in Section 5.2, the unanimity rule would be vulnerable to autocratic shocks and eventually slip into a dictatorship-like regime.

For the Venetian Republic, it is difficult for us to speculate whether political persecution would occur under an non-unanimous rule, because the unanimity rule in Venice, as we have discussed in Section 5.2, had been not only strong but also resilient. What we do know is that under this unanimity rule, Venice was famous for its "impartial justice" and "a freedom of speech and a toleration for individual views that were a byword throughout Italy [and] the whole Europe" (Finer, 1997b, p. 1017). Together with this was the fact that Venice "was never prey to civil war and even its civil disturbances were small beer, absolutely and relatively" (Finer, 1997b, p. 1016), as discussed in Section 5.2.

When the Athenian democracy was at its full strength, unanimity rule held not only in the form of overlapping of authorities of all relevant organs, but also in the principle that "with the rarest exceptions, [the] one-year term [and selection] by casting lots (*sortition*) [and] rotation [for] all posts" granted an extremely high frequency of direct participation in political decision to each individual of "the entire citizen body" (Finer, 1997a, p. 344–368). Under this unanimity rule, although ostracism as political trial ran the risk of being "sometimes abused," the main theme was that "in any event it was not often used, and after 415 [BC] faded out of existence altogether," serving its "calming influence" primarily from the off-equilibrium path (Finer, 1997a, p. 356–357). Consistently, when Madison (2008, p. 52) claims that the Athenian, "pure democracy" was domestically "violent" and "incompatible with personal security or the rights of property," Finer (1997a, p. 362) refutes

this view, "as far as Athens is concerned, as demonstrably false" – "[n]ot merely false: they are *contrevérités.*"

In both the French *Ancien Régime* and the Crown of Castile, it had been easy for the king to capture the judicial power. In France, despite the "mutual enmity between [the king] and the [judicial] *Parlement,*" the king "could use ...the authority with which [the *Parlement*] was endowed ...masterfully for his own purposes" (Cuttler, 1981, p. 115); in Castile, "the potential for abuse [of the judicial power] was ever present," and the king "fail[ed] to adhere to the legal standards set forth in the royal codes" by "deceitful inquests" and "execution without trial" of noblemen (O'Callaghan, 1993, p. 45).

Under this background, when "the old [executive] *curia regis* [was] enlarged [and] turned into parliaments, ...the system of imperative mandates," under which "prox[ies] of great seigneurs and prelates [acted in] the *curia regis* ...only as instructed by those who employed [them]," was kept "as a convenient safeguard for the interests of the lay and ecclesiastical lords" and, "with the urban renaissance, 'men of the good towns' or other spokesmen of the commons" (Lord, 1930, p. 128, 138; Ulph, 1951, p. 226). The mandate system "was ...the norm in the French Estates General when it met," and the consultation "talk[ing] directly to local notables or deputies [or] assembl[ies]" continued even when the Estates General did not meet regularly (Stasavage, 2020a, p. 129; Myers, 1975, p. 70); on the Iberian Peninsula, "[m]andates were widely applied by towns ...who sent representatives to assemblies," and "in Castile and Leon [they were] ...almost constantly used, ...explicit and almost unchangeable" (Stasavage, 2020a, p. 129; Holden, 1930, p. 889, 895). As we have discussed in Section 5.2, the system in practice granted each constituency individual veto power because their right to "indefinitely postpone" and "suspend" decisions made a *de facto* unanimity rule (Holden, 1930, p. 898; Ulph, 1951, p. 226; Lewis, 1962, p. 14).

In the Dutch Republic, the *ad hoc* judiciary's "arrests and ...trials ...of Oldenbarnevelt and his associates," which we have mentioned above, "were totally illegal [a]ccording to any strict interpretation of the principle of provincial sovereignty" (Price, 1994, p. 214). This was accompanied by the "purge [of] pro-Remonstrant nobles from positions of influence" managed by "Maurits [van Oranje,] now the presiding figure, [i.e., the *Stadholder,*] in the state" (Israel, 1995, p. 450). Although Maurits "took ...steps to ...subordinate the States of Holland to himself," the mandate system and individual veto power of each province in the States General "remained unchanged": "[i]n principle, the delegations [from the provinces] were strictly bound by their instructions"; "it was clear that in principle unanimity was necessary in all important matters," and each province "had a veto in the States General" (Israel, 1995, p. 450–451; Price, 1994, p. 212–213, 279).[19] The logic behind the unanimity

---

[19]Admittedly, "the refusal of any one of them to agree to a given measure could, at a pinch, be ignored"

rule was that, "[i]t is evident that neither …the subordination of Holland to the will of the majority of the provinces [n]or, conversely, subjection of the weaker provinces to the direction of Holland," i.e., no non-unanimity rule, "could have …construct[ed] a stable and workable system," and "either was likely to lead to the break-up of the Union, or at least to severe domestic unrest" (Price, 1994, p. 278–279).[20] In this sense, the unanimity rule "was in fact the cornerstone of the Union" (Price, 1994, p. 279).

6   Evolution of Separation of Powers, and Beyond

The main theme of our theory is that unchecked political authority may attract contest for such authority, making it a cause rather than a solution to the Hobbesian war "of all against all." We developed a dynamic game of political contest and persecution in a king's council. Propositions 1 and 2 show that in a weakly institutionalized environment, which is captured by the concept of Markov perfect equilibrium, only unanimity rule in the council can prevent perpetual contests for political authority and preserve civil peace. As we endogenize the council's decision rule, Propositions 3 and 4 show that, although unanimity rule is stable, its resilience depends critically upon having the agenda-setting power in constitutional design separated from the head of the executive, so that any non-unanimity rule would not collapse into dictatorship. When we incorporate a persecution-overseeing judiciary, Proposition 5 shows that the judiciary can lift society under non-unanimity rule, such as majority rule, out of perpetual contests over political authority only if the judiciary is embedded in an interconnected, socially cohesive elite circle and if career paths of the judicial members are sufficiently insulated from the executive. We discussed the implications of these results in the realms of institutions, history, and political theory.

We hope that our paper opens new directions for future research. One such direction is related to separation of powers, on which we elaborate here. Durkheim (2014) famously reads modernization as a socioeconomic transition of the interpersonal relationship from "mechanical solidarity" to "organic solidarity." In this reading, mechanical solidarity is based on similarities among individuals, such as their clan, race, and religion, consistent with low interdependence of social life across these identities; on the contrary, organic solidarity is based on elaborate division of labor and functional complementarity between dissimilar

(Price, 1994, p. 279). That said, the consequence of this temporary breach of unanimity rule had been limited by the design that "[t]he presidency of the assembly changed every week, being held by a representative of each province in turn" (Price, 1994, p. 212).

[20]Specifically, "[a]ny political system which allowed Holland to be regularly coerced into having to support policies which were against its perceived interests could not have lasted long," whereas "the same principle also afforded the weaker provinces an important measure of protection from the danger of being overwhelmed by Holland" (Price, 1994, p. 279).

people, conferring a high degree of interdependence among them.

If we take the Durkheimian reading of modernization seriously while putting all the propositions in this paper together, a hypothesis about the evolution of separation of powers emerges. We summarize it in Figure 4. Proposition 5 implies that before modernization, i.e., under mechanical solidarity, even an insulated judiciary would not preempt the risk of perpetual civil conflict under non-unanimity rule. Propositions 1 and 2 suggest that such society would rely on unanimity rule, whereas Proposition 3 and 4 imply that for the unanimity rule to be resilient, separating the *executive* power from the *legislative* power would be crucial. Moreover, under a resilient unanimity rule, persecution would be impossible, so a separate judicial branch would not be an necessity. After modernization, i.e., under organic solidarity, by Proposition 5, societies could enjoy civil peace under a non-unanimity rule, such as the majority rule, provided that members of the *executive* and *judicial* powers are kept separate in their career paths. Since such societies do not have to adopt unanimity rule, separating the executive power from the legislative power would not be necessary. Therefore, modernization may have shifted the focus of separation of powers from between the *executive and legislative* powers to between the *executive and judicial* powers.
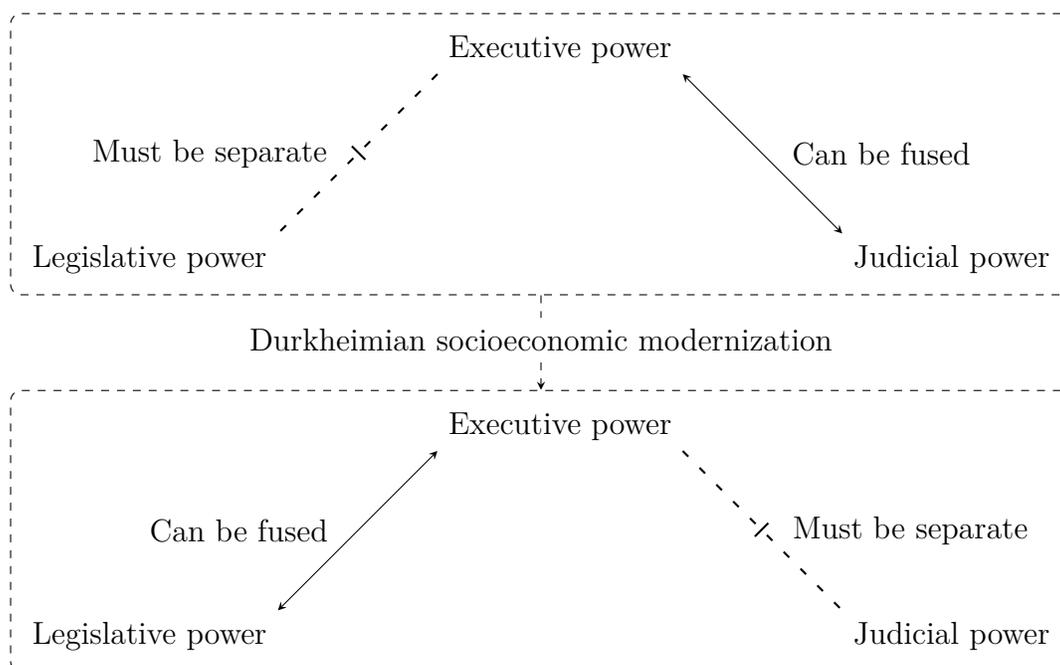

Summary of implications of Propositions 1, 2, 3, 4, 5, and Durkheim (2014).

Figure 4: Socioeconomic modernization and separation of powers

This hypothesis is consistent with the English experience during the 17th–18th centuries. Throughout the 17th century, "the crux of politics [was] greater control of Parliament by

the executive or greater independence from it" (Plumb, 1967, p. 32). In particular, the Parliament fought hard to maintain that "no member of this House shall accept of any office, or place of profit from the Crown without leave of this House," separating the executive from the legislature to prevent "the Crown's agent[s] corrupting the Commons," especially on constitutional issues at that time (Plumb, 1967, p. 48). Eventually "in 1689 the Commons enjoyed [such] a freedom and ...independence that ...Parliament ...was free to ...formulate those constitutional changes that it felt necessary for its protection" (Plumb, 1967, p. 64–65).

This separation between the executive and legislature on constitutional issues, together with "[e]ach member of the trinity of king, lords, and commons [being] equal and ...possess[ing] an independent veto" (Weston, 1965, p. 2), turned out to be a bygone solution to the perpetual conflict under a non-unanimity rule when the connection, interdependence, and social cohesion among the elites and society in general were too low. Modernization had been underway since the second half of the 17th century, so that civil peace under non-unanimity rule had become possible; this was realized with the decoupling of the judiciary from the executive, largely through the Treason Act of 1695 and the Act of Settlement 1701. Equally remarkable was that "the famous clause that 'No person who holds an office of profit under the Crown, should be capable of serving in Parliament' was ...repealed [from] the Act of Settlement [1701] [b]efore it was brought into operation" – "the 'decoupled' Crown and Parliament were 'recoupled'" exactly when the executive–judicial separation was institutionalized (Plumb, 1967, p. 144–145; Finer, 1997c, p. 1354)!

This shift of the focus of separation of powers was also reflected in the commentaries on the English experience from the leading thinkers at that time. Tuckness (2020) observes that, shortly after the Glorious Revolution of 1688, "Locke['s] idea of separation of powers [concerns] [f]irst and foremost ...the legislative power [and] then [t]he executive power," while "Locke does not mention the judicial power as a separate power [or] distinct function [to] the legislative and executive functions," i.e. the situation that we have modeled in Sections 2 and 3. Note that in 1748, Montesquieu elevated "the power of judging" to one of the "three sorts of powers [i]n each state" and emphasized separation between the executive and judicial powers: "[p]olitical liberty in a citizen is that tranquillity of spirit which comes from the opinion each one has of his security, and ...[n]or is there liberty if the power of judging is not separate ...from executive power [because] the judge could have the force of an oppressor" (Montesquieu, 1989, p. 156–157).

The hypothesis about the shift of the focus of separation of powers is also consistent with the process of socioeconomic and political modernization in many other European states, such as France, Belgium, Germany, Hungary, Holland, Denmark, Piedmont, and Greece in the 19th century (Finer, 1997c, p. 1591). As Finer (1997c, p. 1589, 1591) observes, there

were first "numerous …constitutional monarchies," whose "distinguishing principle" was "a freestanding and hereditary chief executive [who] takes all executive decisions through ministers responsible to himself alone …working with an elected legislature," i.e., separating the executive and legislative power. At the same time, "[b]y the nineteenth century, …that connotation [of] a frame of political society *organized through and by the law* for the purpose of restraining arbitrary power …had spread all over Europe" (Finer, 1997c, p. 1571). Under this backdrop, "within a brief time …many …constitutional monarchies …evolved into parliamentarism," which were defined by having members of the executive "responsible to the legislature," i.e., without separating the executive and legislative power (Finer, 1997c, p. 1589–1591).

If we take this hypothesis seriously, we may go further to hypothesize the existence of a specific path of political development: before modernization, once an independent legislature was established, it consolidated the veto powers under unanimity rule, conferring civil peace (Propositions 2 and 4); this peace in turn facilitated economic growth and socioeconomic modernization, making the elites and society in general more interconnected and socially more cohesive (e.g., Durkheim, 2014); the ensuing socioeconomic diversification demanded and accelerated professionalization of law, helping insulate the judicial power from the executive (e.g., Weber, 1978; Deflem, 2008); eventually, the process would allow the political regime to fuse the legislature and the executive and bring the so-called "modern democracy," which "must grapple …with [the] problem of 'tyranny of the majority'" because "political participation is broad but episodic" and "blocking power" and "a need for consensus" is weaker than under unanimity rule (Proposition 5; Stasavage, 2020a, p. 17; Weber, 1978, p. 295; 2004, p. 47). Although beyond the scope of the current paper, efforts in this direction are warranted.

Appendix

A   Proof of Lemma 1

Proof. Consider any particular Markov strategy profile. First, for any given proposal of persecution, consider the voting decision of each ordinary member in a given period. For any ordinary member who is not on the persecution list, she is indifferent about the proposal given the continuation strategies in the Markov strategy profile, so she will vote for it. For any ordinary member who is on the persecution list, passing the proposal will generate a zero payoff and exit, whereas blocking it will generate $R > 0$ at the end of the current period, with the non-negative continuation value of surviving into the next period under the

continuation strategies in the Markov strategy profile, so she will vote against it.

Now consider the king's choice of the size of the persecution proposal p_t in the Markov strategy profile. Suppose the strategy profile is subgame perfect. Then the king must be taking the above-characterized voting decision of each ordinary member as given. For any given $e \geq 2$, if the king chooses $p_t \geq e$, the proposal will be rejected, and the king will get δV^K, where V^K is the continuation payoff for the king under the continuation strategies in the Markov strategy profile; if the king chooses $p_t \leq e-1$, the king will get $p_t \kappa R/(1-\delta)+\delta V^K$. Since the payoff from persecution and expropriation $p_t \kappa R/(1-\delta)$ is positive and is strictly increasing in $p_t \in \{0, 1, \ldots, N-1\}$, the king must thus choose $p_t = e - 1$, the largest size of the persecution proposal that can still be approved by the council.

For $e = 1$, the king cannot get any persecution approved. Given the infinitesimal cost for any $p_t \geq 1$, he will thus choose $p_t = 0$.

Therefore, for the Markov strategy profile to be subgame perfect, i.e., to be an MPE, for any $e \in \{1, 2, \ldots, N\}$ the king must chooses $e' = e - 1$ and the council will eventually approve to persecute $e - 1$ ordinary members. □

B   Proof of Proposition 1

Proof. We would like to show that as $\delta \to 1$, first, the strategy profile in consideration is an MPE and, second, it is the unique MPE.

Claim 1. As $\delta \to 1$, the strategy profile in consideration is an MPE. To prove Claim 1, as $\delta \to 1$, we need to compare each ordinary member's payoffs 1) under this strategy profile and 2) under a single deviation from the strategy profile only at the contest stage of period t, where she will unilaterally not contest the kingship. First, consider her payoff under the strategy profile. It is

$$V^M = \left(1 - \Pi^M(N)\right) \cdot 0 + \Pi^M(N) \cdot V^K = \Pi^M(N) \cdot V^K, \tag{8}$$

where $\Pi^M(N)$ is her probability to win the contest, and V^K is the value of being the new king under the strategy profile. Notice that the value of being the new king under the strategy profile is

$$V^K = (e - 1)\frac{\kappa R}{1 - \delta} + \delta \cdot \Pi^K(N) \cdot V^K = \frac{(e - 1)\frac{\kappa R}{1-\delta}}{1 - \delta\Pi^K(N)}. \tag{9}$$

Therefore, her payoff under the strategy profile is

$$V^M = \Pi^M(N) \cdot \frac{(e-1)\frac{\kappa R}{1-\delta}}{1 - \delta\Pi^K(N)}. \tag{10}$$

Second, consider her payoff under the single deviation, i.e., she will unilaterally not contest the kingship only in period t. The payoff is

$$V' = \frac{N-e}{N-1} \cdot \left(R + \delta V^M\right) = \frac{N-e}{N-1} \cdot \left(R + \delta\Pi^M(N) \cdot \frac{(e-1)\frac{\kappa R}{1-\delta}}{1 - \delta\Pi^K(N)}\right), \tag{11}$$

where $(N-e)/(N-1)$ is the probability for member i to escape persecution in period t; R is the flow payoff from her asset; V^M is the value of being an ordinary member who survives period t under the continuation strategies in the Markov strategy profile.

Now compare the two payoffs, V^M and V', when $\delta \to 1$. Notice that by Equations (10) and (11), the difference between them is

$$V^M - V' = \left(1 - \frac{N-e}{N-1} \cdot \delta\right) \cdot \Pi^M(N) \cdot \frac{(e-1)\frac{\kappa R}{1-\delta}}{1 - \delta\Pi^K(N)} - \frac{N-e}{N-1} \cdot R \to \infty \quad \text{as} \quad \delta \to 1, \tag{12}$$

because the council's decision rule is non-unanimous, i.e., $e \geq 2$. Therefore, the ordinary member is strictly worse under the single deviation than under the strategy profile in consideration, i.e., $V^M - V' > 0$ as $\delta \to 1$. The strategy profile in consideration is thus an MPE as $\delta \to 1$.

Claim 2. As $\delta \to 1$, this proven MPE is the unique MPE. To prove this claim, suppose that there exists an alternative Markov strategy profile that is an MPE, in which, following Lemma 1, the king and the ordinary council members at each persecution stage must still have $e-1$ ordinary members persecuted. We would like to show that this alternative Markov strategy profile cannot be an MPE.

To do that, first, we need to further characterize this supposed strategy profile. Since it is different from the one we have considered, then there must exist a period, which we denote as t, in which at least one ordinary member, whom we denote as i, will not contest the kingship at the contest stage. Since this supposed strategy profile is a Markov strategy profile, then under it, this ordinary member i must not contest from period t onwards as long as she survives.

We want to show that this ordinary member i can be better off under a single deviation from the supposed strategy profile, where she will change to contest only in period t. To do

that, we need to compare, as $\delta \to 1$, her payoffs 1) under this supposed strategy profile and 2) under the single deviation from it. First, consider her payoff under the supposed strategy profile. It is

$$V^M = \frac{N-e}{N-1} \cdot \left(R + \delta V^M\right) = \frac{\frac{N-e}{N-1} \cdot R}{1 - \frac{N-e}{N-1} \cdot \delta},\tag{13}$$

where $(N-e)/(N-1)$ is the probability for her to escape persecution in period t; R is the flow payoff from her asset; V^M is her value if she survives period t under the continuation strategies of the supposed Markov perfect strategy profile.

Second, consider this ordinary member i's payoff under the single deviation, i.e., she will unilaterally change into contesting only in period t. The payoff is

$$V'' = \left(1 - \Pi^M(Q')\right) \cdot 0 + \Pi^M(Q') \cdot V^K = \Pi^M(Q') \cdot V^K,\tag{14}$$

where Q' is the resulting number of participants of the contest under the single deviation, which satisfies $Q' = \max\{2, Q+1\}$; V^K is the value of being the new king at the beginning of the persecution stage under the continuation strategies in the strategy profile.

Notice that this value of being the new king is

$$V^K = (e-1)\frac{\kappa R}{1-\delta} + \delta \cdot \Pi^K(Q) \cdot V^K = \frac{(e-1)\frac{\kappa R}{1-\delta}}{1 - \delta\Pi^K(Q)},\tag{15}$$

where $Q \neq 1$ is the number of participants of the contest for the kingship in each period given the continuation strategies in the supposed Markov perfect strategy profile. We generalize $\Pi^K(Q)$ to cover the case of $Q = 0$ by defining $\Pi^K(0) \equiv 1$. Therefore, this ordinary member i's payoff under the single deviation is

$$V'' = \Pi^M(Q') \cdot \frac{(e-1)\frac{\kappa R}{1-\delta}}{1 - \delta\Pi^K(Q)},\tag{16}$$

Now compare the two payoffs, V^M and V'', when $\delta \to 1$. Notice that by Equation (13) and $e \geq 2$, V^M is bounded; by Equation (16) and $e \geq 2$, V'' approaches infinity as δ approaches 1. Therefore, we have

$$V'' - V^M = \Pi^M(Q') \cdot \frac{(e-1)\frac{\kappa R}{1-\delta}}{1 - \delta\Pi^K(Q)} - \frac{\frac{N-e}{N-1} \cdot R}{1 - \frac{N-e}{N-1} \cdot \delta} \to \infty \quad \text{as} \quad \delta \to 1.\tag{17}$$

Therefore, as $\delta \to 1$, $V'' - V^M > 0$. As $\delta \to 1$, this ordinary member i can be better off under the single deviation from the supposed strategy profile, which implies that the supposed strategy profile cannot be an MPE. Claim 2 is thus proven by contradiction.

Gather Claims 1 and 2. By Claims 1 and 2, when the council's decision rule is non-unanimous, i.e., $e \geq 2$, as $\delta \to 1$, the strategy profile considered in the proposition is the unique MPE of the baseline model. . □

C Proof of Proposition 2

Proof. We would like to show first that the strategy profile in consideration is an MPE and second that it is the unique MPE.

Claim 1. The strategy profile in consideration is an MPE. To prove Claim 1, we need to compare each ordinary member's payoffs 1) under this strategy profile and 2) under a single deviation from the strategy profile only at the contest stage of period t, where she will unilaterally contest the kingship. First, her payoff under the strategy profile is

$$V^M = \frac{R}{1 - \delta} > 0. \tag{18}$$

Second, her payoff under the single deviation is

$$V' = \Pi^M(2) \cdot 0 = 0, \tag{19}$$

because any king will not be able to persecute anyone. Obviously, $V^M > V'$. Therefore, the strategy profile in consideration is an MPE.

Claim 2. This proven MPE is the unique MPE. To prove this claim, suppose that there exists an alternative Markov strategy profile that is an MPE, in which, following Lemma 1 and by $e = 1$, the king and the ordinary council members at each persecution stage will still not have any ordinary members persecuted. We would like to show that this alternative Markov strategy profile cannot be an MPE.

Under this supposed strategy profile, there must exist a period t in which at least one ordinary member i, will contest the kingship at the contest stage.

We would like to show that this ordinary member i can be better off under a single deviation from the supposed strategy profile, where she will change into not contesting only in period t. To do that, we need to compare her payoffs 1) under this supposed strategy profile and 2) under the single deviation from it. First, her payoff under the supposed strategy profile is

$$V^M = \Pi^M(Q) \cdot 0 = 0, \tag{20}$$

where we denote by Q the number of participants of the contest under the supposed Markov perfect strategy profile, while any king will not be able to persecute anyone. Second, her payoff under the single deviation is

$$V'' = R + \delta \cdot V^M = R. \tag{21}$$

Obviously $V'' > V^M$. Therefore, this ordinary member i can be better off under the single deviation from the supposed strategy profile, which implies that the supposed strategy profile cannot be an MPE. Claim 2 is thus proven by contradiction.

Gather Claims 1 and 2. By Claims 1 and 2, when the council's decision rule is unanimous, i.e., $e = 1$, the strategy profile considered in the proposition is the unique MPE of the baseline model. $\qquad\square$

D   Proof of Lemma 2

Proof. We want to show first that an MPE can include the strategies in consideration and second that any MPE cannot include alternative Markov strategies that would lead to unanimity being replaced by a non-unanimous decision rule.

Claim 1. An MPE can include the strategies in consideration. To prove this claim, we want to show, first, that if the agenda-setter proposes $e'_{t+1} \geq 2$, then no ordinary council member will be better off under a single deviation from the strategies in consideration, where she will unilaterally vote for the proposal in period t. Second, we want to show that the agenda-setter will not be better off under a single deviation either, where she would propose a change in the decision rule in period t.

First observe that each ordinary council member's payoff under the strategies in consideration is $V = \delta \cdot R/(1 - \delta)$. Second, consider a single deviation and, as required by sincere voting, suppose that the deviating ordinary member is pivotal, i.e., the single deviation can get $e'_{t+1} \geq 2$ approved. Then the deviating ordinary member will contest in period $t + 1$, losing her asset for sure. Therefore, under the single deviation, she will not have any asset to generate any safe flow payoff however other players will behave; as a result, the best she will be able to hope for will be to become an ever-expropriating and thus ever-contested king

63

onwards. This means her expected payoff will be bounded from above by

$$\bar{V}' = \delta\Pi^M(N) \cdot \frac{(N-1)\kappa R}{1-\delta} + \left(\delta\Pi^K(N)\right) \cdot \left(\delta\Pi^M(N)\right) \cdot \frac{(N-1)\kappa R}{1-\delta}$$
$$+ \left(\delta\Pi^K(N)\right)^2 \cdot \left(\delta\Pi^M(N)\right) \cdot \frac{(N-1)\kappa R}{1-\delta} + \cdots = \frac{\delta\Pi^M(N)\frac{(N-1)\kappa R}{1-\delta}}{1-\delta\Pi^K(N)}. \qquad (22)$$

Observe that, by $\delta \in (0,1)$, $\kappa \in (0,1)$, and $(N-1) \cdot \Pi^M(N) + \Pi^K(N) = 1$, we have $V > \bar{V}'$. Therefore, even if the single deviation can get $e'_{t+1} \geq 2$ to be approved, the deviating ordinary member will not be better off.

What about the agenda-setter? Given the ordinary council members' strategies in consideration, no proposal to change the decision rule will be approved and the current decision rule will remain, i.e., $e_{t+1} = e_t = 1$. Second, proposing a change will incur an infinitesimal cost $\epsilon > 0$, making not proposing more advantageous. Therefore, the agenda-setter will not be better off by proposing a change in the decision rule.

No player will thus be better off under a single deviation from the strategies in consideration. The strategies in consideration can thus included by an MPE. Claim 1 is proven.

Claim 2. Any MPE cannot include alternative Markov strategies that would lead to unanimity being replaced. To prove this claim, we suppose that there exist alternative Markov perfect strategies where the agenda-setter will propose an alternative decision rule $e'_{t+1} \geq 2$ and the ordinary council members will vote for it.

Now consider a single deviation for one ordinary council member, where she will unilaterally vote against the proposal in period t. Her expected payoff under this single deviation is

$$V'' = \delta R + \delta^2 \cdot \Pi^M(N) \cdot V^K, \qquad (23)$$

where R is the safe flow payoff she will receive in period $t+1$, since given $e_t = 1$, she has blocked the change in the decision rule by her single vote and made $e_{t+1} = e_t = 1$; $\Pi^M(N)$ is her possibility to become a king in period t; V^K is the expected payoff for a king after the contest stage in the supposed MPE. In the supposed MPE, instead, the same ordinary member's expected payoff is

$$V^M = \delta \cdot \Pi^M(N) \cdot V^K \geq 0, \qquad (24)$$

because everyone will contest in period $t+1$.

Now consider V^K:

$$V^K = \frac{(e'_{t+1} - 1)\kappa R}{1 - \delta} + \delta \cdot V^K_{t+2} \leq \frac{(N-1)\kappa R}{1 - \delta} + \delta \cdot V^K_{t+2}, \tag{25}$$

where V^K_{t+2} is the expected payoff for a king before the contest stage at $t + 2$. Now consider V^K_s for any $s \geq t + 2$:

$$V^K_s \leq \max\left\{\delta \cdot V^K_{s+1}, \Pi^K(N) \cdot \left(\frac{(N-1)\kappa R}{1-\delta} + \delta \cdot V^K_{s+1}\right)\right\}, \tag{26}$$

where V^K_{s+1} is the expected payoff for a king before the contest stage at $s + 1$, because the decision rule will be either unanimity or not at $s \geq t + 2$. With these at hand, by careful induction, one can show that $V^K \leq \left(\frac{(N-1)\kappa R}{1-\delta}\right) / \left(1 - \delta\Pi^K(N)\right)$. As the induction is lengthy, we prove it as a separate lemma, Lemma D.1, after this current proof.

With this upper bound of V^K, now compare V'' and V^M:

$$V'' - V^M = \delta R + \delta^2 \cdot \Pi^M(N) \cdot V^K - \delta \cdot \Pi^M(N) \cdot V^K = \delta R - \delta \cdot \Pi^M(N) \cdot (1 - \delta) \cdot V^K$$

$$\geq \delta R - \delta \cdot \Pi^M(N) \cdot (1 - \delta) \cdot \frac{\frac{(N-1)\kappa R}{1-\delta}}{1 - \delta \cdot \Pi^K(N)} = \delta R \left(1 - \frac{(N-1) \cdot \Pi^M(N)\kappa}{1 - \delta \cdot \Pi^K(N)}\right) > 0, \tag{27}$$

since $(N - 1) \cdot \Pi^M(N) + \Pi^K(N) = 1$, $\delta \in (0, 1)$, and $\kappa \in (0, 1)$. Therefore, each ordinary council member will be better off under the single deviation. Therefore, the supposed MPE is not an MPE, contradicting what we have supposed. Claim 2 is thus proven by contradiction.

Gather Claims 1 and 2. By Claims 1 and 2, unanimity is thus stable in any MPE. The proposition is thus proven. □

Lemma D.1. *In the proof of Lemma 2, when proving Claim 2, the claim*

$$V^K \leq \frac{\frac{(N-1)\kappa R}{1-\delta}}{1 - \delta\Pi^K(N)} \tag{28}$$

is true.

Proof. Denote the countable set of future periods $s \geq t + 2$ whenever $\delta \cdot V^K_{s+1} > \Pi^K(N) \cdot$

$\left(\frac{(N-1)\kappa R}{1-\delta} + \delta \cdot V_{s+1}^K \right)$ as $\{s_n\}_{n=1}$. This implies that

$$V_s^K \le \begin{cases} \delta \cdot V_{s+1}^K, & \text{if } s \in \{s_n\}_{n=1}; \\ \Pi^K(N) \cdot \left(\frac{(N-1)\kappa R}{1-\delta} + \delta \cdot V_{s+1}^K \right), & \text{if otherwise.} \end{cases} \tag{29}$$

Note that this set can be empty, have a finite number of elements, or have an infinite number of elements. Without loss of generality, suppose $s_1 \ge t+4$ and $s_2 \ge s_1+2$. Now first iterate to period s_1: by Inequations (25), (26), and (29), we have

$$
\begin{aligned}
V^K &\le \frac{(N-1)\kappa R}{1-\delta} + \delta \cdot V_{t+2}^K \le \frac{(N-1)\kappa R}{1-\delta} + \delta \cdot \Pi^K(N) \cdot \left(\frac{(N-1)\kappa R}{1-\delta} + \delta \cdot V_{t+3}^K \right) \\
&= \frac{(N-1)\kappa R}{1-\delta} + \delta \Pi^K(N) \cdot \frac{(N-1)\kappa R}{1-\delta} + \Pi^K(N)\delta^2 \cdot V_{t+3}^K \\
&\le \frac{(N-1)\kappa R}{1-\delta} \cdot \sum_{s=0}^{2} \left(\delta \Pi^K(N) \right)^s + \Pi^K(N)^2 \delta^3 \cdot V_{t+4}^K \\
&\le \frac{(N-1)\kappa R}{1-\delta} \cdot \sum_{s=0}^{s_1-t-2} \left(\delta \Pi^K(N) \right)^s + \Pi^K(N)^{s_1-t-2} \delta^{s_1-t-1} \cdot V_{s_1}^K \\
&\le \frac{(N-1)\kappa R}{1-\delta} \cdot \sum_{s=0}^{s_1-t-2} \left(\delta \Pi^K(N) \right)^s + \Pi^K(N)^{s_1-t-2} \delta^{s_1-t-1} \cdot \delta \cdot V_{s_1+1}^K.
\end{aligned}
\tag{30}
$$

Then iterate to period s_2: by Inequations (26), (29), and (30) and $\delta \in (0,1)$, we have

$$
\begin{aligned}
V^K &\le \frac{(N-1)\kappa R}{1-\delta} \cdot \sum_{s=0}^{s_1-t-2} \left(\delta \Pi^K(N) \right)^s + \Pi^K(N)^{s_1-t-2} \delta^{s_1-t-1} \cdot \delta \Pi^K(N) \cdot \left(\frac{(N-1)\kappa R}{1-\delta} + \delta \cdot V_{s_1+2}^K \right) \\
&= \frac{(N-1)\kappa R}{1-\delta} \cdot \sum_{s=0}^{s_1-t-2} \left(\delta \Pi^K(N) \right)^s + \Pi^K(N)^{s_1-t-1} \delta^{s_1-t-1} \cdot \delta \cdot \frac{(N-1)\kappa R}{1-\delta} \\
&\quad + \Pi^K(N)^{s_1-t-1} \delta^{s_1-t} \cdot \delta \cdot V_{s_1+2}^K \\
&< \frac{(N-1)\kappa R}{1-\delta} \cdot \sum_{s=0}^{s_1-t-1} \left(\delta \Pi^K(N) \right)^s + \Pi^K(N)^{s_1-t-1} \delta^{s_1-t} \cdot \delta \cdot V_{s_1+2}^K \\
&\le \frac{(N-1)\kappa R}{1-\delta} \cdot \sum_{s=0}^{s_2-t-3} \left(\delta \Pi^K(N) \right)^s + \Pi^K(N)^{s_2-t-3} \delta^{s_2-t-2} \cdot \delta \cdot V_{s_2}^K \\
&\le \frac{(N-1)\kappa R}{1-\delta} \cdot \sum_{s=0}^{s_2-t-3} \left(\delta \Pi^K(N) \right)^s + \Pi^K(N)^{s_2-t-3} \delta^{s_2-t-2} \cdot \delta^2 \cdot V_{s_2+1}^K.
\end{aligned}
\tag{31}
$$

Now denote $n_\tau \leq \tau - (t+2)$ as the number of future periods s that are between $t+2$ and $\tau - 1$ and are in $\{s_n\}_{n=1}$. Observing the induction above, when we iterate to period τ, we will have two cases. First, if $n_\tau \geq 1$, then, by $\delta \in (0,1)$, we will have

$$
\begin{aligned}
V^K &< \frac{(N-1)\kappa R}{1-\delta} \cdot \sum_{s=0}^{\tau-t-2-n_\tau} \left(\delta \Pi^K(N)\right)^s + \Pi^K(N)^{\tau-t-2-n_\tau} \delta^{\tau-t-1-n_\tau} \cdot \delta^{n_\tau} \cdot V_\tau^K \\
&= \frac{(N-1)\kappa R}{1-\delta} \cdot \sum_{s=0}^{\tau-t-2-n_\tau} \left(\delta \Pi^K(N)\right)^s + \Pi^K(N)^{\tau-t-2-n_\tau} \delta^{\tau-t-1} \cdot V_\tau^K \\
&< \frac{(N-1)\kappa R}{1-\delta} \cdot \sum_{s=0}^{\tau-t-2} \left(\delta \Pi^K(N)\right)^s + \Pi^K(N)^{\tau-t-2-n_\tau} \delta^{\tau-t-1} \cdot V_\tau^K;
\end{aligned}
\tag{32}
$$

second, if $n_\tau = 0$, then we will have

$$
V^K \leq \frac{(N-1)\kappa R}{1-\delta} \cdot \sum_{s=0}^{\tau-t-2} \left(\delta \Pi^K(N)\right)^s + \Pi^K(N)^{\tau-t-2} \delta^{\tau-t-1} \cdot V_\tau^K.
\tag{33}
$$

Note that these two cases can just collapse into

$$
V^K \leq \frac{(N-1)\kappa R}{1-\delta} \cdot \sum_{s=0}^{\tau-t-2} \left(\delta \Pi^K(N)\right)^s + \Pi^K(N)^{\tau-t-2-n_\tau} \delta^{\tau-t-1} \cdot V_\tau^K.
\tag{34}
$$

Therefore, by iterating the induction to the infinite future, i.e., letting τ approach infinity, we have

$$
V^K \leq \frac{\frac{(N-1)\kappa R}{1-\delta}}{1-\delta\Pi^K(N)} + \lim_{\tau\to\infty} \left(\Pi^K(N)^{\tau-t-2-n_\tau} \delta^{\tau-t-1} \cdot V_\tau^K\right).
\tag{35}
$$

Note that V_τ^K is always bounded by $\left(\frac{(N-1)\kappa R}{1-\delta}\right)/(1-\delta)$ because the king will not be able to do better than surviving and expropriating $N-1$ ordinary council members for sure in each period, and this upper bound is finite; also, note that $n_\tau \leq \tau - (t+2)$ and $\Pi^K(N) \in (0,1)$, so $\Pi^K(N)^{\tau-t-2-n_\tau} \in (0,1)$, i.e., it is finite, too. Therefore, by $\delta \in (0,1)$, we have

$$
\lim_{\tau\to\infty} \left(\Pi^K(N)^{\tau-t-2-n_\tau} \delta^{\tau-t-1} \cdot V_\tau^K\right) = 0
\tag{36}
$$

and thus

$$
V^K \leq \frac{\frac{(N-1)\kappa R}{1-\delta}}{1-\delta\Pi^K(N)}.
\tag{37}
$$

$\square$

E Proof of Proposition 3

Proof. By Lemma 2, we know that unanimity is stable. To prove the rest of the proposition, we want to show that, in any MPE, first, if $e_t = N$, the king will not propose to change the decision rule; second, if $2 \le e_t \le N - 1$, then the king proposing $e'_{t+1} = N$ and all ordinary council members voting for it can be part of an MPE; third, if $2 \le e_t \le N - 1$, no alternative Markov strategies that would lead to $e_{t+1} \ne N$ can be part of an MPE.

Claim 1. In any MPE, if $e_t = N$, the king will not propose to change the decision rule. First, note that if $e_t = N$, the king's proposal e'_{t+1} will become e_{t+1} automatically. Thus, we do not need to specify the voting decisions of the ordinary council members.

Now we check whether a single deviation, where the king will propose $e'_{t+1} \in \{1, 2, \ldots, N\}$, will make the king better off or not. First, note that without any deviation, the king's expected payoff is

$$V^K = \delta \Pi^K(N) \cdot \frac{(N-1)\kappa R}{1-\delta} + \left(\delta \Pi^K(N)\right)^2 \cdot \frac{(N-1)\kappa R}{1-\delta} + \cdots = \frac{\delta \Pi^K(N) \cdot \frac{(N-1)\kappa R}{1-\delta}}{1 - \delta \Pi^K(N)}. \quad (38)$$

Second, if the king deviates to propose $e'_{t+1} = 1$, then by Lemma 2, perpetual civil peace will bring him a payoff of $V' = 0$ since the king does not have any asset. Obviously, $V^K > V'$, since unanimity brings perpetual peace without expropriation, while dictatorship brings the opportunity to expropriate. Third, if the king deviates to propose $e'_{t+1} \in \{2, 3, \ldots, N-1\}$, then his expected payoff is at most

$$\bar{V}'' = \delta \Pi^K(N) \cdot \frac{(N-2)\kappa R}{1-\delta} + \left(\delta \Pi^K(N)\right)^2 \cdot \frac{(N-1)\kappa R}{1-\delta}$$
$$+ \left(\delta \Pi^K(N)\right)^3 \cdot \frac{(N-1)\kappa R}{1-\delta} + \cdots = V^K - \delta \Pi^K(N) \cdot \frac{\kappa R}{1-\delta}, \quad (39)$$

i.e., a situation where he could win the contest and expropriate at most $N - 2$ ordinary council members in period $t + 1$ and keep winning and expropriate at most $N - 1$ ordinary members from period $t + 2$ onwards. Observe that $V^K > \bar{V}''$, since she will expropriate at least one fewer ordinary council members at the persecution stage of period $t + 1$ if he proposes $e'_{t+1} \in \{2, 3, \ldots, N-1\}$. Finally, if the king deviates to propose $e'_{t+1} = N$, he will just pay the additional cost of proposal for no change. Therefore, any single deviation will not make the king better off, i.e., not proposing any change from $e_t = N$ can be part of an MPE.

Now we check whether a MPE can include an alternative strategy for the king. We examine the alternatives one by one. First, consider the strategy where the king will propose

$e'_{t+1} = 1$. By Lemma 2, this strategy in an MPE will lead to perpetual peace and no expropriation, generating a payoff of $-\epsilon$. A single deviation from it, where the king will propose $e'_{t+1} \geq 2$, would at least generate an expected payoff of $\delta\Pi^K(N)\kappa R/(1 - \delta) > 0$ because of the possible winning and expropriation in period $t+1$, making the king better off. Therefore, this considered strategy cannot be part of an MPE. Second, consider the strategy where the king will propose $e'_{t+1} = N$. A single deviation from it whereby the king will not propose any change in the decision rule only in period t, will save the king the infinitesimal cost of proposing. Therefore, this considered strategy cannot be part of an MPE, either. Finally, consider any strategy that the king will propose $e'_{t+1} = e' \in \{2, 3, \ldots, N - 1\}$. The king's expected payoff is

$$\tilde{V} = \delta\Pi^K(N) \cdot V^K(e_{t+1} = e'), \tag{40}$$

where $V^K(e_{t+1} = e')$ is the value of being a king after the contest stage in period $t+1$. Under a single deviation from the supposed MPE, where the king will propose $e'_{t+1} = N$ instead only in period t, will generate the expected payoff

$$V''' = \delta\Pi^K(N) \cdot \left(\frac{(N-1)\kappa R}{1 - \delta} + \delta\Pi^K(N) \cdot V^K(e_{t+1} = e')\right). \tag{41}$$

Note that

$$V^K(e_{t+1} = e') < \frac{\frac{(N-1)\kappa R}{1-\delta}}{1 - \delta\Pi^K(N)}, \tag{42}$$

since the king can only expropriate $e' - 1 < N - 1$ ordinary members in period $t + 1$. Therefore,

$$\begin{aligned} V''' - \tilde{V} &= \delta\Pi^K(N) \cdot \left(\frac{(N-1)\kappa R}{1 - \delta} - \left(1 - \delta\Pi^K(N)\right) \cdot V^K(e_{t+1} = e')\right) \\ &> \delta\Pi^K(N) \cdot \left(\frac{(N-1)\kappa R}{1 - \delta} - \frac{(N-1)\kappa R}{1 - \delta}\right) = 0, \end{aligned} \tag{43}$$

i.e., the king will be better off under the single deviation. Therefore, this considered strategy cannot be part of an MPE either. Therefore, any MPE cannot include any alternative strategy for the king.

We have now established that not proposing any change from $e_t = N$ can be part of an MPE and any MPE cannot include any alternative strategy for the king. Claim 1 is thus proven.

Claim 2. If $2 \leq e_t \leq N - 1$, then the king proposing $e'_{t+1} = N$ and all ordinary council members voting for it can be part of an MPE. To prove the claim, we need

to check whether the king or an ordinary council member can be better off under a single deviation from the strategies in consideration, supposing that the continuation strategies constitute an MPE.

Now examine whether an ordinary council member can be better off under a single deviation, where she will vote against the proposal only in period t, supposing that the continuation strategies constitute an MPE. Note that the strategies in consideration will give her an expected payoff of

$$V^M = \delta \Pi^M(N) \cdot \left(\frac{(N-1)\kappa R}{1-\delta} + V^K(e_{t+2} = N) \right) \tag{44}$$

where

$$V^K(e_{t+2} = N) = \delta \Pi^K(N) \cdot \frac{\frac{(N-1)\kappa R}{1-\delta}}{1 - \delta \Pi^K(N)}, \tag{45}$$

is, by Claim 1, the value of being the king after the contest and persecution stages in period $t+1$ in any MPE. The single deviation, if it can get the proposal rejected, will give the deviating ordinary member an expected payoff of

$$V' = \delta \Pi^M(N) \cdot \left(\frac{(e_t - 1)\kappa R}{1-\delta} + V^K(e_{t+2} = N) \right). \tag{46}$$

Since $e_t \leq N$, we have $V^M > V'$. Therefore, the single deviation cannot make the deviating ordinary member better off, even if the single deviation can get the proposal rejected, supposing that the continuation strategies constitute an MPE.

Now examine whether the king can be better off under a single deviation, where the king instead does not propose a change in the decision rule or proposes $e'_{t+1} = e' \in \{2, 3, \ldots, N - 1\} \setminus \{e_t\}$ or $e'_{t+1} = 1$ only in period t. First, note that, supposing that the continuation strategies constitute an MPE, the strategies in consideration will give the king an expected payoff of

$$V^K(e_{t+1} = N) = \delta \Pi^K(N) \cdot \frac{\frac{(N-1)\kappa R}{1-\delta}}{1 - \delta \Pi^K(N)}, \tag{47}$$

by Claim 1. Second, if the king does not propose a change in the decision rule only in period t, he will get

$$V'' = \delta \Pi^K(N) \cdot \left(\frac{(e_t - 1)\kappa R}{1-\delta} + V^K(e_{t+2} = N) \right). \tag{48}$$

Supposing the continuation strategies constitute an MPE, by Claim 1, $V^K(e_{t+1} = N) = V^K(e_{t+2} = N)$. Therefore, by $e_t \leq N - 1$, we have $V^K(e_{t+1} = N) > V''$, i.e., the king will not be better off under this single deviation. Third, if the king proposes $e'_{t+1} = e' \leq N - 1$

instead only in period t, then, no matter whether it will be approved, the king will get at most

$$\bar{V}''' = \delta \Pi^K(N) \cdot \left(\frac{(N-2)\kappa R}{1-\delta} + V^K(e_{t+2} = N) \right). \tag{49}$$

Again, we have $V^K(e_{t+1} = N) > \bar{V}'''$, i.e., the king will not be better off under this single deviation. Finally, if the king proposes $e'_{t+1} = 1$ only in period t, then, if it is approved by the council, by Lemma 2 he will not have any opportunity to expropriate in perpetual civil peace, supposing that the continuation strategies constitute an MPE; if it is rejected by the council, by a logic similar to just above, he will still expropriate fewer than $N-1$ ordinary members in period $t+1$. In both cases, he will not be better off. Therefore, we conclude that the king cannot be better off under a single deviation, supposing that the continuation strategies constitute an MPE.

We have now established that neither the king nor an ordinary council member can be better off under a single deviation from the strategies in consideration, supposing the continuation strategies constitute an MPE. The strategies in consideration can thus be part of an MPE. Claim 2 is thus proven.

Claim 3. If $2 \le e_t \le N-1$, any MPE cannot include alternative Markov strategies for the king or the ordinary council members that would lead to $e_{t+1} \ne N$. There are several possibilities for the alternative strategies: first, the king does not propose any change in the decision rule; second, the king proposes $e'_{t+1} = 1$ and the ordinary members vote for it; third, the king proposes $e'_{t+1} = e_t$ and the ordinary members may or may not vote for it; finally, the king proposes $e'_{t+1} \in \{2, 3, \ldots, N-1\} \setminus \{e_t\}$ and the ordinary members vote for it. We examine these alternatives one by one.

First, suppose that not proposing any change in the decision rule is part of an MPE. The king's expected payoff in the supposed MPE is thus

$$V^K(e_{t+1} = e_t) = \delta \Pi^K(N) \cdot \left(\frac{(e_t - 1)\kappa R}{1-\delta} + V^K(e_{t+2} = e_t) \right), \tag{50}$$

where $V^K(e_{t+2} = e_t)$ is the value of being the king after persecution in period $t+1$, knowing that the decision rule $e_{t+2} = e_{t+1} = e_t$ in period $t+2$. Now consider a single deviation where the king will instead propose $e'_{t+1} = N$ only in period t. By the proof of Claim 2, in any MPE the ordinary members will approve $e'_{t+1} = N$, and by Claim 1, in any MPE, $e_{t+1} = N$ is an absorbing state. Therefore, the king's expected payoff under the single deviation is thus

$$V'''' = \delta \Pi^K(N) \cdot \left(\frac{(N-1)\kappa R}{1-\delta} + V^K(e_{t+2} = N) \right). \tag{51}$$

Since $e_t < N$ and $V^K(e_{t+2} = e_t) \leq V^K(e_{t+2} = N)$ as non-dictatorship, non-unanimous regimes could have persecuted at least one more ordinary members, we have $V^K(e_{t+1} = e_t) < V''''$. Therefore, a single deviation can make the king better off, suggesting that the supposed MPE is not an MPE. Therefore, not proposing any change in the decision rule cannot be part of an MPE.

Second, suppose that the king proposing $e'_{t+1} = 1$ and the ordinary members voting for it can be part of an MPE. The king's expected payoff in the supposed MPE is thus zero, since by Lemma 2, unanimity is an absorbing state in any MPE and will bring civil peace and no persecution. Now consider a single deviation where the king will not propose a change in the decision rule only in period t. The single deviation will bring at least $\delta \Pi^K(N) \cdot \frac{(e_t - 1)\kappa R}{1-\delta} > 0$ to the king in expectation. Therefore, the king can be better off under the single deviation, suggesting that the supposed MPE is not an MPE. Therefore, the king proposing $e'_{t+1} = 1$ and the ordinary members voting for it cannot be part of an MPE.

Third, suppose that the king proposing $e'_{t+1} = e_t$ and the ordinary members voting for or against it can be part of an MPE. A single deviation where the king does not propose anything will thus save him the infinitesimal cost. Therefore, the king can be better off under the single deviation, suggesting that the supposed MPE is not an MPE. Therefore, the king proposing $e'_{t+1} = e_t$ and the ordinary members voting for or against it cannot be part of an MPE.

Finally, suppose that the king proposing $e'_{t+1} = e' \in \{2, 3, \ldots, N-1\} \setminus \{e_t\}$ and the ordinary members voting for it can be part of an MPE. By Claim 1, in any MPE, $e_{t+1} = N$ is an absorbing state, so the king's expected payoff in this supposed MPE is at most

$$\bar{V} = \delta \Pi^K(N) \cdot \left(\frac{(e' - 1)\kappa R}{1 - \delta} + V^K(e_{t+2} = N) \right). \tag{52}$$

Now consider a single deviation where the king proposes $e'_{t+1} = N$ instead only in period t. By the proof of Claim 2, in any MPE the ordinary members will approve $e'_{t+1} = N$, and by Claim 1, in any MPE, $e_{t+1} = N$ is an absorbing state, again. Therefore, the king's expected payoff under the single deviation is thus, again,

$$V'''' = \delta \Pi^K(N) \cdot \left(\frac{(N - 1)\kappa R}{1 - \delta} + V^K(e_{t+2} = N) \right). \tag{53}$$

Since $e' < N$, we have $\bar{V} < V''''$. Therefore, a single deviation can make the king better off, suggesting that the supposed MPE is not an MPE. Therefore, the king proposing $e'_{t+1} = e' \in \{2, 3, \ldots, N-1\} \setminus \{e_t\}$ and the ordinary members voting for it cannot be part of an MPE.

We have now established that an MPE cannot include any alternative Markov strategies

for the king or the ordinary council members that would lead to $e_{t+1} \neq N$. Claim 2 is proven.

Gather Lemma 2 and Claims 1, 2, and 3. The proposition is thus proven. □

F   Proof of Proposition 4

Proof. By Lemma 2, we have known that unanimity is stable. To prove the rest of the proposition, we want to show that, if $e_t \geq 2$, first, the agenda-setting ordinary council member proposing $e'_{t+1} = 1$ and all ordinary council members voting for it can be part of an MPE; second, no MPE can include any alternative Markov strategies that would lead to $e_{t+1} \neq 1$. Also note that we do not need to specify the king's strategy, since when $e_t \geq 2$, he cannot on his own block any proposal of constitutional revision.

Claim 1. The agenda-setting ordinary council member proposing $e'_{t+1} = 1$ and all ordinary council members voting for it can be part of an MPE. To prove this claim, we need to examine whether a single deviation can make the players better off. First, notice that, supposing the continuation strategies constitute an MPE, then by Lemma 2, the decision rule will stay at unanimity under the strategy in consideration, and the expected payoff of each ordinary council member in the constitutional convention will be

$$V^M(e_{t+1} = 1) = \delta \cdot \frac{R}{1 - \delta}. \tag{54}$$

Second, consider a single deviation by an voting ordinary council member, where she will unilaterally vote against $e'_{t+1} = 1$ only in period t. If the deviation can cause the proposal to be rejected, then the deviating ordinary member's expected payoff will be

$$V' = \delta \Pi^M(N) \cdot \frac{(e_t - 1)\kappa R}{1 - \delta}, \tag{55}$$

i.e., she hopes to become the king in period $t + 1$ so that she can persecute and expropriate, but that would give her no additional payoffs in the future civil peace from period $t + 2$ onwards brought by unanimity, as she will not have any asset then. Note that by $e_t \leq N$, $(N - 1)\Pi^M(N) < 1$, and $\kappa \in (0, 1)$, we have

$$V' = \delta \Pi^M(N) \cdot \frac{(e_t - 1)\kappa R}{1 - \delta} \leq \delta \cdot \frac{(N - 1)\Pi^M(N)\kappa R}{1 - \delta} < \delta \cdot \frac{R}{1 - \delta} = V^M(e_{t+1} = 1). \tag{56}$$

Therefore, even if the single deviation could get $e'_{t+1} = 1$ rejected, it cannot make the deviating ordinary member better off.

Third, consider another single deviation by the agenda-setting ordinary council member, where she will propose $e'_{t+1} \geq 2$ or not propose any change in the decision rule instead only in period t. Under the single deviation, her expected payoff is, by $e_t \leq N$, at most

$$\bar{V}'' = \delta \Pi^M(N) \cdot \frac{(N-1)\kappa R}{1 - \delta}, \tag{57}$$

i.e., again, she hopes to become the king in period $t + 1$ so that she can persecute and expropriate, but that would give her no additional payoffs in the future civil peace from period $t + 2$ onwards brought by unanimity, as she will not have any asset then. Again, by $(N-1)\Pi^M(N) < 1$ and $\kappa \in (0, 1)$, we have $\bar{V}'' < V^M(e_{t+1} = 1)$. Therefore, the single deviation cannot make the agenda-setting ordinary council member better off.

We have thus established that no single deviation from the strategies in consideration can make any ordinary council members better off. Therefore, the strategies in consideration can be part of an MPE. Claim 1 is thus proven.

Claim 2. Any MPE cannot include any alternative Markov strategies that would lead to $e_{t+1} \neq 1$. There are two possibilities for the alternative Markov strategies: first, the agenda-setting ordinary council member does not propose a change in the decision rule; second, she proposes $e'_{t+1} \in \{2, 3, \ldots, N\} \setminus \{e_t\}$ and all ordinary council members vote for the proposal. We now examine whether a single deviation from these alternatives can make the deviating player better off.

First, note that, under both of the possibilities of the alternative strategies, period $t + 1$ will have an non-unanimity rule. The period-t agenda-setting ordinary council member will thus have her asset destroyed in the all-out contest in period t. Therefore, her expected payoff in the constitutional convention in period t is, by $e_{t+1} \leq N$, at most

$$\bar{V} = \delta \Pi^M(N) \cdot \frac{\frac{(N-1)\kappa R}{1-\delta}}{1 - \delta \Pi^K(N)}. \tag{58}$$

Second, consider a single deviation from either of the alternative strategies, where the agenda-setting council member will propose $e'_{t+1} = 1$ instead only in period t. Note that by the proof of Claim 1, in any MPE, if $e'_{t+1} = 1$ is proposed, then all ordinary council members will vote for it; also, by Lemma 2, in any MPE, unanimity is an absorbing state. Therefore, under the single deviation and given the continuation strategies in the supposed MPE, the period-t agenda-setting ordinary council member's expected payoff is

$$V''' = \delta \cdot \frac{R}{1 - \delta}, \tag{59}$$

74

i.e., the safe returns from the asset in perpetual peace brought by unanimity. Further note that, by $(N-1)\Pi^M(N) + \Pi^K(N) = 1$, $\kappa \in (0,1)$, and $\delta \in (0,1)$, we have

$$\bar{V} = \delta\Pi^M(N) \cdot \frac{\frac{(N-1)\kappa R}{1-\delta}}{1-\delta\Pi^K(N)} < \delta \cdot \frac{\frac{\left(1-\Pi^K(N)\right)\cdot R}{1-\delta}}{1-\delta\Pi^K(N)} < \delta \cdot \frac{\frac{\left(1-\delta\Pi^K(N)\right)\cdot R}{1-\delta}}{1-\delta\Pi^K(N)} = \delta \cdot \frac{R}{1-\delta} = V'''. \quad (60)$$

Therefore, the single deviation can make the agenda-setting ordinary council member better off, suggesting that the supposed MPE is not an MPE. Therefore, both of the possible alternative strategies cannot be part of an MPE. Claim 2 is thus proven.

Gather Claims 1 and 2. The proposition is thus proven. $\qquad\square$

G   Proof of Lemma 3

Proof. We need to examine whether each player would be better off by switching to a single deviation from the considered strategy profile. First, consider any non-political judge i. Her expected payoff under the considered strategy profile is

$$V^N = \frac{R_{i,t-1}}{1-\delta}. \quad (61)$$

Her expected payoff under a single deviation, i.e., voting against only the current persecution proposal, is

$$V' = \frac{R_{i,t-1}}{1-\delta} = V^N, \quad (62)$$

regardless of whether she is pivotal. As we have assumed that all judges will vote for any persecution proposal when indifferent, she would not switch to the single deviation.

Second, consider any political judge i. Her expected payoff under the considered strategy profile is

$$V^P = R_{i,t-1} + \delta\left(z \cdot V^M + (1-z)V^P\right), \quad (63)$$

where V^M is the expected value of being an ordinary council member at the start of period $t+1$. Her expected payoff under a single deviation, i.e., voting against only the current persecution proposal, is

$$V'' = R_{i,t-1} + \delta\left(z \cdot V^M + (1-z)V^P\right) = V^P, \quad (64)$$

regardless of whether she is pivotal. As we have assumed that all judges will vote for any persecution proposal when indifferent, she would not switch to the single deviation.

Third, consider the king at the persecution stage. Given the continuation strategies in the considered strategy profile, no transfer is needed to influence the judges into voting for the persecution proposal; when he is choosing the number of ordinary council members to persecute, his choice does not affect his continuation value after period t, but choosing $p_t = e - 1$ maximizes his expected expropriation profit in period t. Therefore, no single deviation from the considered strategy profile can better him off.

Fourth, consider any ordinary council member at the contest stage. Her expected payoff under the considered strategy profile is

$$V^M = \Pi^M(N) \cdot \left(\frac{(e-1)\kappa R}{1 - \delta} + \delta V^K \right) \geq 0, \tag{65}$$

where V^K is the expected value of being the king at the start of period $t + 1$ and $e \geq 2$. Her expected payoff under a single deviation, i.e., not contesting only in period t, is

$$\bar{V} = 0 \leq V^M, \tag{66}$$

because, given others' strategies in the considered strategy profile, she will become the unique most senior ordinary member at the following persecution stage and thus be persecuted for sure. Therefore, the single deviation cannot be profitable.

No player could be better off by switching to a single deviation from the considered strategy profile. The lemma is thus proven. $\qquad\square$

H   Proof of Lemma 4

Proof. We prove the three claims one by one.

Claim 1.   First, examine any non-political judge i's strategy given any persecution proposal with p_t ordinary members to be persecuted. Suppose that she is pivotal. Her expected payoff from voting for the proposal is

$$V^N = (1 - cp_t)R + T_{it} + \delta \cdot \frac{(1 - cp_t)R}{1 - \delta} = T_{it} + \frac{(1 - cp_t)R}{1 - \delta}, \tag{67}$$

where R is her potential return to asset because $\theta_t = 1$, while $(1 - cp_t)R$ is the current and future flow payoff from her asset given the persecution externality in the current period and everyone following the MPE in Lemma 3 in all future periods. Her expected payoff under a

single deviation, i.e., voting against and thus blocking the proposal, is

$$V' = R + \delta \cdot \frac{R}{1-\delta} = \frac{R}{1-\delta}, \tag{68}$$

where R is her current and future flow payoff because no persecution would happen in the current persecution stage and everyone will still follow the MPE in Lemma 3 in all future periods, while she receives no transfer because she votes against the current persecution proposal. Given that we have assumed that she will vote for the proposal even if indifferent, she will thus vote for the proposal if and only if $V^N \geq V'$, i.e.,

$$T_{it} \geq cp_t \cdot \frac{R}{1-\delta}. \tag{69}$$

The claim is thus proven.

Claim 2. Second, examine any political judge i's strategy given any persecution proposal of p_t ordinary members. Suppose that she is pivotal. Her expected payoff from voting for the proposal is

$$V^P = (1 - cp_t)R + T_{it} + \delta \bigg(z \cdot V^M + (1-z)$$

$$\cdot \Big((1 - cp_t)R + \delta \big(z \cdot V^M + (1-z) \cdot \dots \big) \Big) \bigg)$$

$$= T_{it} + \frac{(1 - cp_t)R}{1 - \delta(1-z)} + \frac{\delta z V^M}{1 - \delta(1-z)}, \tag{70}$$

where
$$V^M = \frac{\pi^M(N)}{1 - \delta\Pi^K(N)} \cdot \frac{(e-1)\kappa R}{1-\delta} \tag{71}$$

is the value of being an ordinary council member at the beginning of period $t+1$ following the MPE in Lemma 3 in all future periods. Her expected payoff under a single deviation, i.e., voting against and thus blocking the proposal, is

$$V'' = R + \delta \bigg(z \cdot V^M + (1-z) \cdot \Big(R + \delta \big(z \cdot V^M + (1-z) \cdot \dots \big) \Big) \bigg)$$

$$= \frac{R}{1 - \delta(1-z)} + \frac{\delta z V^M}{1 - \delta(1-z)}. \tag{72}$$

Given that we have assumed that she will vote for the proposal even if indifferent, she will thus vote for the proposal if and only if $V^P \geq V''$, i.e.,

$$T_{it} \geq cp_t \cdot \frac{R}{1 - \delta(1-z)}. \tag{73}$$

The claim is thus proven.

Claim 3. Finally, examine the king's decision at the persecution stage. Suppose that he proposes to persecute p_t ordinary council members. For the proposal to be approved, he needs to commit sufficient transfers to $\bar{N} - \bar{e} + 1$ judges. By Claims 1 and 2 and $z \in (0,1)$, it is cheaper to influence a political judge than a non-political one. Therefore, the total amount of transfers needed is

$$
\begin{aligned}
T &= \min\{\bar{N} - \bar{e} + 1, w\} \cdot cp_t \cdot \frac{R}{1 - \delta(1-z)} + \max\{\bar{N} - \bar{e} + 1 - w, 0\} \cdot cp_t \cdot \frac{R}{1 - \delta} \\
&= \begin{cases} (\bar{N} - \bar{e} + 1) \cdot cp_t \cdot \frac{R}{1 - \delta(1-z)}, & \text{if } w \geq \bar{N} - \bar{e} + 1; \\ w \cdot cp_t \cdot \frac{R}{1 - \delta(1-z)} + (\bar{N} - \bar{e} + 1 - w) \cdot cp_t \cdot \frac{R}{1 - \delta}, & \text{if } w < \bar{N} - \bar{e} + 1. \end{cases}
\end{aligned} \tag{74}
$$

subject to the budget

$$B = p_t \cdot \frac{\kappa R}{1 - \delta}. \tag{75}$$

Note as $\delta \to 1$, if $w \geq \bar{N} - \bar{e} + 1$, then $T \leq B$ will always hold; when $w < \bar{N} - \bar{e} + 1$, $T \leq B$ will hold if and only if

$$\left(\bar{N} - \bar{e} + 1 - w\right) c < \kappa. \tag{76}$$

Note that if $w \geq \bar{N} - \bar{e} + 1$, then $\left(\bar{N} - \bar{e} + 1 - w\right) c \leq 0 < \kappa$. Therefore, as $\delta \to 1$, the king can get any persecution proposal approved if $\left(\bar{N} - \bar{e} + 1 - w\right) c < \kappa$, and cannot otherwise get any persecution proposal approved. Given the infinitesimal cost of a persecution proposal, he will thus not propose to persecute any ordinary council members.

Now consider how many ordinary council members the king would like to persecute, given that he can get the proposal approved as $\delta \to 1$. The king's expected payoff from proposing to persecute p_t ordinary members is

$$V^K(p_t) = p_t \cdot \frac{\kappa R}{1 - \delta} - T + \delta V_{t+1}^K, \tag{77}$$

subject to

$$p_t \in \{0, 1, \ldots, e - 1\}, \quad \left(\bar{N} - \bar{e} + 1 - w\right) c < \kappa. \tag{78}$$

where T is the total transfers, which depends on p_t, and where V_{t+1}^K is the value of being the

king at the beginning of period $t+1$ following the MPE in Lemma 3 in all future periods, which is not dependent on the current p_t. The king will thus choose $p_t = e - 1$ to maximize his expected payoff.

The claim and the lemma are thus proven. □

I Proof of Proposition 5

Proof. We prove the three claims one by one.

Claim 1. Consider the following strategy profile for any period t:

- at $\theta_t = 0$, all players follow the MPE in Lemma 3;

- at $\theta_t = 1$,

  - at the contest stage, all ordinary council members contest;

  - at the persecution stage,

    * if there has been a contest in the contest stage,

      · the king proposes to persecute $e - 1$ ordinary members and commits to transfer $T_{it} = c(e-1) \cdot \frac{R}{1-\delta(1-z)}$ to each of $\min\{\bar{N} - \bar{e} + 1, w\}$ political judges and $T_{it} = c(e-1) \cdot \frac{R}{1-\delta}$ to each of $\max\{\bar{N} - \bar{e} + 1 - w, 0\}$ non-political judges;

      · any non-political judge i will vote for any persecution proposal that would persecutes p_t ordinary council members at the current persecution stage if and only if the transfer proposed to her satisfies $T_{it} \geq cp_t \cdot R/(1-\delta)$;

      · any political judge i will vote for any persecution proposal at the current persecution stage if and only if the transfer proposed to her satisfies $T_{it} \geq cp_t \cdot R/\left(1 - \delta(1-z)\right)$;

    * if there has not been a contest in the preceding contest stage,

      · the king proposes to persecute $e - 1$ ordinary members and commits to transfer $T_{it} = c(e-1) \cdot \frac{R}{1-\delta(1-z)} - \delta z \Pi^M(N) \cdot T^*$ to each of $\min\{\bar{N} - \bar{e} + 1, w\}$ political judges and $T_{it} = c(e-1) \cdot \frac{R}{1-\delta}$ to each of $\max\{\bar{N} - \bar{e} + 1 - w, 0\}$ non-political judges;

      · any non-political judge i will vote for any persecution proposal that would persecutes p_t ordinary council members at the current persecution stage if and only if the transfer proposed to her satisfies $T_{it} \geq cp_t \cdot R/(1-\delta)$;

· any political judge i will vote for any persecution proposal at the current persecution stage if and only if the transfer proposed to her satisfies $T_{it} \geq cp_t \cdot \frac{R}{1-\delta(1-z)} - \delta z \Pi^M(N) \cdot T^*$,

where

$$T^* = \begin{cases} (\bar{N} - \bar{e} + 1) \cdot c(e-1) \cdot \frac{R}{1-\delta(1-z)}, & \text{if } w \geq \bar{N} - \bar{e} + 1; \\ w \cdot c(e-1) \cdot \frac{R}{1-\delta(1-z)} + (\bar{N} - \bar{e} + 1 - w) \cdot c(e-1) \cdot \frac{R}{1-\delta}, & \text{if } w < \bar{N} - \bar{e} + 1. \end{cases} \quad (79)$$

We want to show that this strategy profile is an MPE. Note that, by Lemma 3, the strategies at $\theta_t = 0$ are Markov perfect; by $\kappa > (\bar{N} - w - \bar{e} + 1) c$, $\delta \to 1$, and Lemma 4, the strategy of the king at the persecution stage at $\theta_t = 1$ when there has been a contest in the preceding contest stage is feasible and Markov perfect; by Lemma 4, the strategies of the judges at $\theta_t = 1$ when there has been a contest in the preceding contest stage are Markov perfect, too. We thus only need to examine, first, whether the strategy of each ordinary council member at the contest stage with $\theta_t = 1$ is Markov perfect and, second, whether the strategies of the king and judges at the persecution stage with $\theta_t = 1$ when there has not been a contest in the contest stage are Markov perfect.

First, consider the strategy of each ordinary council member at the contest stage with $\theta_t = 1$. Under the strategy profile in consideration, if $\kappa > (\bar{N} - w - \bar{e} + 1) c$ and $\delta \to 1$, each ordinary council member's expected payoff is $V^M = \Pi^M(N) \cdot V^K$, where $V^K > 0$ is the value of being the king at the beginning of the persecution stage, since the king will afford to persecute $e - 1 \geq 1$ ordinary members and gain a strictly positive profit in the current period. Under a single deviation, i.e., not contesting only in the current contest stage, her expected payoff is $V' = 0 < V^K$, since she will become the most senior ordinary member in the persecution stage and thus will be persecuted for sure. Therefore, the strategy of each ordinary council member at the contest stage with $\theta_t = 1$ is Markov perfect.

Second, consider the strategies of the king and judges at the persecution stage with $\theta_t = 1$ when there has not been a contest in the contest stage. First, consider any non-political judge i. Suppose she is pivotal. Under the strategy profile in consideration, as in the proof of Lemma 4, her expected payoff is

$$V^N = (1 - cp_t)R + T_{it} + \delta \cdot \frac{(1-cp_t)R}{1-\delta} = T_{it} + \frac{(1-cp_t)R}{1-\delta}, \quad (80)$$

where R is her potential return to asset because $\theta_t = 1$, while $(1-cp_t)R$ is the current and future flow payoff from her asset given the persecution externality in the current period and everyone following the MPE in Lemma 3 in all future periods. Her expected payoff under a

single deviation, i.e., voting against and thus blocking the proposal, is

$$V' = R + \delta \cdot \Bigg(\big(1 - c(e-1)\big)R + T^*_{i,t+1}$$

$$+ \delta \Big(\big(1 - c(e-1)\big)R + \delta \cdot \big(\big(1 - c(e-1)\big)R + \ldots \big) \Big) \Bigg)$$

$$= R + \delta \left(T^*_{i,t+1} + \frac{\big(1 - c(e-1)\big)R}{1 - \delta} \right) = R + \delta \left(\frac{c(e-1)R}{1 - \delta} + \frac{\big(1 - c(e-1)\big)R}{1 - \delta} \right)$$

$$= \frac{R}{1 - \delta}, \tag{81}$$

where no persecution would happen in the current persecution stage, everyone will still follow the continuation strategies in the strategy profile in consideration in all future periods, and the focal non-political judge will be prioritized to receive a transfer in period $t+1$, i.e.,

$$T^*_{i,t+1} = \frac{c(e-1)R}{1 - \delta}. \tag{82}$$

Given that we have assumed that she will vote for the proposal even if indifferent, she will thus vote for the proposal if and only if $V^N \geq V'$, i.e.,

$$T_{it} \geq cp_t \cdot \frac{R}{1 - \delta}. \tag{83}$$

Therefore, the strategy of each non-political judge at the persecution stage with $\theta_t = 1$ when there has not been a contest in the preceding contest stage is Markov perfect.

Second, consider any political judge i at the persecution stage with $\theta_t = 1$ when there has not been a contest in the preceding contest stage. Suppose she is pivotal. Under the strategy profile in consideration, as in the proof of Lemma 4, her expected payoff is

$$V^P = (1 - cp_t)R + T_{it} + \delta \Bigg(z \cdot V^M + (1 - z)$$

$$\cdot \Big((1 - cp_t)R + \delta \big(z \cdot V^M + (1 - z) \cdot \ldots \big) \Big) \Bigg)$$

$$= T_{it} + \frac{(1 - cp_t)R}{1 - \delta(1 - z)} + \frac{\delta z V^M}{1 - \delta(1 - z)}, \tag{84}$$

where

$$V^M = \frac{\Pi^M(N)}{1 - \delta \Pi^K(N)} \cdot \frac{(e-1)\kappa R}{1 - \delta} \tag{85}$$

is the value of being an ordinary council member at the beginning of period $t+1$ following the MPE in Lemma 3 in all future periods. Her expected payoff under a single deviation, i.e., voting against and thus blocking the proposal, is

$$
\begin{aligned}
V'' &= R + \delta \cdot \Bigg(z \cdot \tilde{V}^M + (1-z) \cdot \Bigg(\big(1 - c(e-1)\big) R + T^*_{i,t+1} \\
&\qquad + \delta \Big(z \cdot V^M + (1-z) \\
&\qquad\qquad \cdot \Big(\big(1 - c(e-1)\big) R + \delta \Big(z \cdot V^M + (1-z) \cdot \ldots \Big) \Big) \Big) \Bigg) \Bigg) \\
&= R + \delta \left(z\tilde{V}^M + (1-z)T^*_{i,t+1} + \frac{(1-z)\big(1-c(e-1)\big)R}{1-\delta(1-z)} + \frac{\delta z V^M}{1-\delta(1-z)} \right) \\
&= R + \delta \left(z\tilde{V}^M + \frac{(1-z)c(e-1)R}{1-\delta(1-z)} + \frac{(1-z)\big(1-c(e-1)\big)R}{1-\delta(1-z)} + \frac{\delta z V^M}{1-\delta(1-z)} \right) \\
&= \frac{R}{1-\delta(1-z)} + \delta z \left(\tilde{V}^M + \frac{\delta V^M}{1-\delta(1-z)} \right) \\
&= \frac{R}{1-\delta(1-z)} + \delta z \left(V^M - \Pi^M(N) \cdot T^* + \frac{\delta V^M}{1-\delta(1-z)} \right) \\
&= \frac{R}{1-\delta(1-z)} + \frac{\delta z V^M}{1-\delta(1-z)} - \delta z \Pi^M(N) \cdot T^*,
\end{aligned}
$$
(86)

where no persecution would happen in the current persecution stage;

$$
\tilde{V}^M = \Pi^M(N) \left(\frac{(e-1)\kappa R}{1-\delta} - T^* + \delta \cdot \frac{\Pi^K(N)}{1-\delta\Pi^K(N)} \cdot \frac{(e-1)\kappa R}{1-\delta} \right) = V^M - \Pi^M(N) \cdot T^* \quad (87)
$$

is the value of being an ordinary council member at the beginning of period $t+1$ with $\theta_{t+1} = 1$ under the continuation strategies in the strategy profile in consideration from then onwards;

$$
T^* = \begin{cases} \big(\bar{N} - \bar{e} + 1\big) \cdot c(e-1) \cdot \frac{R}{1-\delta(1-z)}, & \text{if } w \geq \bar{N} - \bar{e} + 1; \\ w \cdot c(e-1) \cdot \frac{R}{1-\delta(1-z)} + \big(\bar{N} - \bar{e} + 1 - w\big) \cdot c(e-1) \cdot \frac{R}{1-\delta}, & \text{if } w < \bar{N} - \bar{e} + 1 \end{cases}
$$
(88)

is the total amount of transfer the king at the persecution stage in period $t+1$ would need to pay under the strategy profile in consideration, as adapted from the proof of Claim 3 in Lemma 4; everyone will follow the continuation strategies in the strategy profile in

consideration in all future periods; the focal political judge, if remains as a judge during period $t + 1$, will be prioritized to receive a transfer in period $t + 1$, i.e.,

$$T_{i,t+1}^* = \frac{c(e-1)R}{1 - \delta(1-z)}. \tag{89}$$

Given that we have assumed that she will vote for the proposal even if indifferent, she will thus vote for the proposal if and only if $V^P \geq V''$, i.e.,

$$T_{it} \geq cp_t \cdot \frac{R}{1 - \delta(1-z)} - \delta z \Pi^M(N) \cdot T^*. \tag{90}$$

Therefore, the strategy of each political judge at the persecution stage when there has not been a contest in the preceding contest stage is Markov perfect.

Finally, consider the king at the persecution stage with $\theta_t = 1$ when there has not been a contest in the contest stage. Suppose that he proposes to persecute p_t ordinary council members. For the proposal to be approved, he needs to commit sufficient transfers to $\bar{N} - \bar{e} + 1$ judges. By $z \in (0, 1)$, it is cheaper to influence a political judge than a non-political one. Therefore, the total amount of transfers needed is

$$\tilde{T} = \min\{\bar{N} - \bar{e} + 1, w\} \cdot \left(cp_t \cdot \frac{R}{1 - \delta(1-z)} - \delta z \Pi^M(N) \cdot T^* \right)$$
$$+ \max\{\bar{N} - \bar{e} + 1 - w, 0\} \cdot cp_t \cdot \frac{R}{1 - \delta}$$
$$= \begin{cases} (\bar{N} - \bar{e} + 1) \cdot \left(cp_t \cdot \frac{R}{1-\delta(1-z)} - \delta z \Pi^M(N) \cdot T^* \right), & \text{if } w \geq \bar{N} - \bar{e} + 1; \\ w \cdot \left(cp_t \cdot \frac{R}{1-\delta(1-z)} - \delta z \Pi^M(N) \cdot T^* \right) + (\bar{N} - \bar{e} + 1 - w) \cdot cp_t \cdot \frac{R}{1-\delta}, & \text{if } w < \bar{N} - \bar{e} + 1, \end{cases} \tag{91}$$

subject to the budget

$$B = p_t \cdot \frac{\kappa R}{1 - \delta}. \tag{92}$$

Note as $\delta \to 1$, if $w \geq \bar{N} - \bar{e} + 1$, then $\tilde{T} \leq B$ will always hold; when $w < \bar{N} - \bar{e} + 1$, given $\kappa > (\bar{N} - \bar{e} + 1 - w) c$, $\tilde{T} \leq B$ will hold, too. Therefore, given $\delta \to 1$ and $\kappa > (\bar{N} - \bar{e} + 1 - w) c$, the king can get any persecution proposal approved.

Now consider how many ordinary council members the king would like to persecute. The king's expected payoff from proposing to persecute $p_t \in \{1, \ldots, e - 1\}$ ordinary members is

$$V^K(p_t) = p_t \cdot \frac{\kappa R}{1 - \delta} - \tilde{T} + \delta V_{t+1}^K, \tag{93}$$

83

where $\tilde{T}$ is the total transfers to give out, which is depending on p_t, and V_{t+1}^K is the value of being the king at the beginning of period $t+1$ following the MPE in Lemma 3 in all future periods, which is not depending on the current p_t. The king will thus choose $p_t = e - 1$ to maximize his expected payoff, getting

$$V^K(e-1) = \frac{(e-1)\kappa R}{1-\delta} - \tilde{T}|_{p_t=e-1} + \delta V_{t+1}^K. \tag{94}$$

If the king decides not to persecute any ordinary member instead, then his expected payoff will be

$$V^K(0) = \delta \tilde{V}_{t+1}^K = \delta \Pi^K(N) \cdot \left(\frac{(e-1)\kappa R}{1-\delta} - T^* + \delta V_{t+1}^K \right), \tag{95}$$

where $\tilde{V}_{t+1}^K$ is the value of being the king at the beginning of period $t+1$ under the continuation strategies in the strategy profile in consideration with $\theta_{t+1} = 1$. Notice that $\tilde{T}|_{p_t=e-1} < T^*$. Therefore, by $\delta \in (0,1)$, $\Pi^K(N) \in (0,1)$, and $\tilde{T}|_{p_t=e-1} < T^*$, we have $V^K(0) < V^K(e-1)$. Therefore, the king will choose to persecute $p_t = e - 1$ ordinary council members. The king persecuting $e - 1$ ordinary members is thus Markov perfect.

To summarize, we have proven that, first, the strategy of each ordinary council member at the contest stage with $\theta_t = 1$ is Markov perfect and, second, the strategies of the king and judges at the persecution stage with $\theta_t = 1$ when there has not been a contest in the preceding contest stage are Markov perfect, too. The strategy profile in consideration is thus an MPE. The claim is thus proven.

Claim 2a. First, by $\kappa \leq \left(\bar{N} - w - \bar{e} + 1\right)c$, $\delta \to 1$, and Lemma 4, in any MPE, if there has been a contest in the preceding contest stage with $\theta_t = 1$, the king at the following persecution stage will not be able to persecute any ordinary council members. Given that, we now examine whether each ordinary member contesting at the contest stage of any period t with $\theta_t = 1$ can be part of an MPE.

Under the strategies in consideration, her expected payoff is

$$V^M = \Pi^M(N) \cdot \delta V^K, \tag{96}$$

where

$$\begin{aligned}
V^K &= \Pi^K(N) \cdot \left(\frac{(e-1)\kappa R}{1-\delta} + \delta \cdot \Pi^K(N) \cdot \left(\frac{(e-1)\kappa R}{1-\delta} + \delta \cdot \Pi^K(N) \cdot \ldots \right) \right) \\
&= \frac{\Pi^K(N)}{1 - \delta \Pi^K(N)} \cdot \frac{(e-1)\kappa R}{1-\delta}
\end{aligned} \tag{97}$$

84

is the value of being the king at the beginning of period $t+1$, since if she becomes the king after the current contest stage, by Lemma 4, she will not be able to persecute anyone as $\delta \to 1$, and everyone will follow the MPE in Lemma 3 from period $t+1$ onwards.

Under a single deviation, i.e., not contesting unilaterally only in the current contest stage, her expected payoff is

$$V'' = R + \delta \left(z \cdot \frac{R}{1-\delta} + (1-z)V^M \right) = R + \delta \left(z \cdot \frac{R}{1-\delta} + (1-z)\Pi^M(N) \cdot \delta V^K \right), \quad (98)$$

where the king at the persecution stage will still not be able to persecute anyone given there has still been a contest in the contest stage, so the ordinary member will survive for sure the current period, get R given $\theta_t = 1$ and no persecution in period t, retire with probability z, and remain as an ordinary council member in period $t+1$ and follow the MPE in Lemma 3 onwards with probability $1-z$.

Now compare V^M and V'': we have

$$
\begin{aligned}
V'' - V^M &= R + \delta \left(z \cdot \frac{R}{1-\delta} + (1-z)\Pi^M(N) \cdot \delta V^K \right) - \Pi^M(N) \cdot \delta V^K \\
&= \frac{\left(1 - \delta(1-z)\right) R}{1-\delta} - \left(1 - \delta(1-z)\right) \Pi^M(N)\delta V^K \\
&= \left(1 - \delta(1-z)\right) \left(\frac{R}{1-\delta} - \Pi^M(N)\delta V^K \right) > 0
\end{aligned}
\quad (99)
$$

if and only if

$$\frac{R}{1-\delta} - \Pi^M(N)\delta V^K > 0. \quad (100)$$

Observe that, by $e \leq N$, $\delta \in (0,1)$, $\kappa \in (0,1)$, $\Pi^K(N) \in (0,1)$, and $(N-1)\Pi^M(N)+\Pi^K(N) = 1$, we have

$$
\begin{aligned}
\frac{R}{1-\delta} - \Pi^M(N)\delta V^K &= \frac{R}{1-\delta} - \Pi^M(N)\delta \cdot \frac{\Pi^K(N)}{1-\delta\Pi^K(N)} \cdot \frac{(e-1)\kappa R}{1-\delta} \\
&> \frac{R}{1-\delta} \cdot \left(1 - \frac{(N-1)\Pi^M(N)}{1-\Pi^K(N)} \right) = \frac{R}{1-\delta} \cdot (1-1) = 0. \quad (101)
\end{aligned}
$$

Therefore, $V'' - V^M > 0$, i.e., the ordinary member can benefit from the single deviation. Contesting at $\theta_t = 1$ given that everyone else is contesting cannot thus be part of an MPE. The claim is thus proven.

Claim 2b. Consider the following strategy profile for any period t:

- at $\theta_t = 0$, all players follow the MPE in Lemma 3;

- at $\theta_t = 1$,

  - at the contest stage, no ordinary council members contest;

  - at the persecution stage,

    * if there has been a contest in the preceding contest stage, the king and judges follow the strategies in Lemma 4;

    * if there has not been a contest in the preceding contest stage,

      · the king proposes not to persecute any ordinary council members;

      · any non-political judge i will vote for any persecution proposal that would persecute p_t ordinary council members at the current persecution stage if and only if the transfer proposed to her satisfies $T_{it} \geq cp_t \cdot R/(1-\delta)$;

      · any political judge i will vote for any persecution proposal at the current persecution stage if and only if the transfer proposed to her satisfies $T_{it} \geq \frac{R}{1-\delta} - \frac{(1-cp_t)R}{1-\delta(1-z)} - \frac{\delta z V^M}{1-\delta(1-z)}$,

where

$$V^M = \frac{\pi^M(N)}{1-\delta\Pi^K(N)} \cdot \frac{(e-1)\kappa R}{1-\delta}. \tag{102}$$

We want to show that this strategy profile is a MPE. Note that, by Lemma 3, the strategies at $\theta_t = 0$ are Markov perfect; by $\kappa \leq (\bar{N} - w - \bar{e} + 1)c$, $\delta \to 1$, and Lemma 4, the strategies at $\theta_t = 1$ when there has been a contest in the preceding contest stage are Markov perfect. We thus only need to examine, first, whether the strategy of each ordinary council member at the contest stage with $\theta_t = 1$ is Markov perfect and, second, whether the strategies of the king and judges at the persecution stage with $\theta_t = 1$ when there has not been a contest in the preceding contest stage are Markov perfect.

First, consider the strategy of each ordinary council member at the contest stage with $\theta_t = 1$. Under the strategy profile in consideration, each ordinary council member's expected payoff is $V^M = R/(1-\delta)$, since she will enjoy the flow payoff of her asset forever given perpetual peace and absence of persecution, regardless of when she will retire. Under a single deviation, i.e., contesting the kingship unilaterally only in period t, her expected payoff will be

$$V''' = \Pi^M(2) \cdot \left(0 + \delta \cdot V_{t+1}^K\right), \tag{103}$$

where $\Pi^M(2)$ is her probability to win the contest, she will not persecute anyone in the

following persecution stage given $\delta \to 1$ and $\kappa \le \left(\bar{N} - w - \bar{e} + 1 \right) c$, and

$$V_{t+1}^K = \frac{\Pi^K(N)}{1 - \delta\Pi^K(N)} \cdot \frac{(e-1)\kappa R}{1 - \delta} \tag{104}$$

is the value of being the king at the beginning of period $t+1$ with $\theta_{t+1} = 0$. Now compare V^M and V''': by $\Pi^K(2) \in (0,1)$, $\delta \in (0,1)$, $e \le N$, $\kappa \in (0,1)$, and $(N-1)\Pi^M(N) + \Pi^K(N) = 1$, we have

$$V^M - V'''$$

$$= \frac{R}{1-\delta} - \Pi^M(2) \cdot \delta \cdot V_{t+1}^K = \frac{R}{1-\delta} - \Pi^M(2) \cdot \delta \cdot \frac{\Pi^K(N)}{1 - \delta\Pi^K(N)} \cdot \frac{(e-1)\kappa R}{1 - \delta}$$

$$= \frac{R}{1-\delta} \cdot \left(1 - \Pi^M(2) \cdot \delta \cdot \frac{\Pi^K(N)}{1 - \delta\Pi^K(N)} \cdot (e-1)\kappa \right)$$

$$> \frac{R}{1-\delta} \cdot \left(1 - \frac{\Pi^M(2)}{\Pi^K(2)} \cdot \frac{(N-1)\Pi^K(N)}{1 - \Pi^K(N)} \right) = \frac{R}{1-\delta} \cdot \left(1 - \frac{\Pi^M(2)}{\Pi^K(2)} \cdot \frac{\Pi^K(N)}{\Pi^M(N)} \right) \ge 0 \tag{105}$$

if and only if

$$\frac{\Pi^K(N)}{\Pi^M(N)} \le \frac{\Pi^K(2)}{\Pi^M(2)}, \tag{106}$$

which we have assumed. Therefore, we have $V^M > V'''$. Every ordinary council member not contesting at $\theta_t = 1$ is thus Markov perfect.

Second, consider the strategies of the king and judges at the persecution stage with $\theta_t = 1$ when there has not been a contest in the contest stage. First, consider any non-political judge i. Suppose she is pivotal. Under the strategy profile in consideration, as in the proof of Lemma 4 and the proof of Claim 1 in the current lemma, her expected payoff is

$$V^N = T_{it} + \frac{(1 - cp_t)R}{1 - \delta}. \tag{107}$$

Her expected payoff under a single deviation, i.e., voting against and thus blocking the proposal, is

$$V'''' = \frac{R}{1 - \delta}. \tag{108}$$

Given that we have assumed that she will vote for the proposal even if indifferent, she will thus vote for the proposal if and only if $V^N \ge V''''$, i.e.,

$$T_{it} \ge cp_t \cdot \frac{R}{1 - \delta}. \tag{109}$$

Therefore, the strategy of each non-political judge at the persecution stage with $\theta_t = 1$ when there has not been a contest in the preceding contest stage is Markov perfect.

Second, consider any political judge i at the persecution stage with $\theta_t = 1$ when there has not been a contest in the preceding contest stage. Suppose she is pivotal. Under the strategy profile in consideration, as in the proof of Lemma 4 and the proof of Claim 1 in the current lemma, her expected payoff is

$$V^P = T_{it} + \frac{(1 - cp_t)R}{1 - \delta(1 - z)} + \frac{\delta z V^M}{1 - \delta(1 - z)}, \tag{110}$$

where

$$V^M = \frac{\Pi^M(N)}{1 - \delta\Pi^K(N)} \cdot \frac{(e - 1)\kappa R}{1 - \delta} \tag{111}$$

is the value of being an ordinary council member at the beginning of period $t + 1$ following the MPE in Lemma 3 in all future periods. Her expected payoff under a single deviation, i.e., voting against and thus blocking the proposal, is

$$V''''' = \frac{R}{1 - \delta}, \tag{112}$$

since she will enjoy the flow payoff of her asset forever given perpetual peace and absence of persecution, regardless of when she will become an ordinary council member and when she will retire. Given that we have assumed that she will vote for the proposal even if indifferent, she will thus vote for the proposal if and only if $V^P \geq V'''''$, i.e.,

$$T_{it} \geq \frac{R}{1 - \delta} - \frac{(1 - cp_t)R}{1 - \delta(1 - z)} - \frac{\delta z V^M}{1 - \delta(1 - z)}. \tag{113}$$

Therefore, the strategy of each political judge at the persecution stage with $\theta_t = 1$ when there has not been a contest in the preceding contest stage is Markov perfect.

Finally, consider the king at the persecution stage with $\theta_t = 1$ when there has not been a contest in the contest stage. Suppose that he proposes to persecute p_t ordinary council members. For the proposal to be approved, he needs to commit sufficient transfers to $\bar{N} - \bar{e} + 1$ judges. Now consider whether the king can afford such transfers. First, suppose the king prioritizes non-political judges. Note that, by $w > 0$ and $\kappa \leq (\bar{N} - w - \bar{e} + 1)c$, for any $p_t \in \{1, 2, \ldots, e - 1\}$, the transfers for $\bar{N} - \bar{e} + 1$ non-political judges, if there are, will cost

$$(\bar{N} - \bar{e} + 1) \cdot cp_t \cdot \frac{R}{1 - \delta} > (\bar{N} - w - \bar{e} + 1) \cdot cp_t \cdot \frac{R}{1 - \delta} \geq p_t \cdot \frac{\kappa R}{1 - \delta}, \tag{114}$$

so the king will not be able to afford such transfers. Second, suppose that the king prioritizes

political judges. Note that, by $\kappa \leq (\bar{N} - w - \bar{e} + 1)c$ and $\kappa > 0$, we have $\bar{N} - w - \bar{e} + 1 > 0$, i.e., there are fewer than $\bar{N} - \bar{e} + 1$ political judges. Also note that, as $\delta \to 1$, we have, by $e \leq N$ and $(N-1)\Pi^M(N) + \Pi^K(N) = 1$,

$$
\begin{aligned}
&\frac{R}{1-\delta} - \frac{(1-cp_t)R}{1-\delta(1-z)} - \frac{\delta z V^M}{1-\delta(1-z)} \\
&= \frac{R}{1-\delta} - \frac{(1-cp_t)R}{1-\delta(1-z)} - \frac{\delta z}{1-\delta(1-z)} \cdot \frac{\Pi^M(N)}{1-\delta\Pi^K(N)} \cdot \frac{(e-1)\kappa R}{1-\delta} \\
&\to \frac{R}{1-\delta} - \frac{\Pi^M(N)}{1-\Pi^K(N)} \cdot \frac{(e-1)\kappa R}{1-\delta} \geq \frac{R}{1-\delta} - \frac{(N-1)\Pi^M(N)}{1-\Pi^K(N)} \cdot \frac{\kappa R}{1-\delta} \\
&= \frac{R}{1-\delta} - \frac{\kappa R}{1-\delta} = \frac{(1-\kappa)R}{1-\delta} > 0,
\end{aligned}
\tag{115}
$$

so, as $\delta \to 1$, for any $p_t \in \{1, 2, \ldots, e-1\}$, the total transfers needed will cost, by $\kappa \leq (\bar{N} - w - \bar{e} + 1)c$,

$$
\begin{aligned}
&w \cdot \left(\frac{R}{1-\delta} - \frac{(1-cp_t)R}{1-\delta(1-z)} - \frac{\delta z V^M}{1-\delta(1-z)} \right) + (\bar{N} - w - \bar{e} + 1) \cdot cp_t \cdot \frac{R}{1-\delta} \\
&> (\bar{N} - w - \bar{e} + 1) \cdot cp_t \cdot \frac{R}{1-\delta} \geq p_t \cdot \frac{\kappa R}{1-\delta}.
\end{aligned}
\tag{116}
$$

The king will thus not be able to afford such transfers. Gathering the two possible cases of prioritization, we know that as $\delta \to 1$, the king will not be able to get any persecution approved in the current persecution stage. Given the infinitesimal cost of proposing persecution, the king not proposing to persecute anyone is thus Markov perfect.

To summarize, we have proven that, first, the strategy of each ordinary council member at the contest stage with $\theta_t = 1$ is Markov perfect and, second, the strategies of the king and judges at the persecution stage with $\theta_t = 1$ when there has not been a contest in the contest stage are Markov perfect, too. The strategy profile in consideration is thus an MPE. The claim and the proposition are thus proven. $\square$
